His putting cobalt (a malleable and ductile metal) among the semi-metals was due to the fact that the nature of this metal was only very imperfectly known at that time.

An assembly or council of citizens invested with a share in the government of a state. Especially—(a) In ancient Rome, a body of citizens appointed or elected from among the patricians, and later from among rich plebeians also, or taking seats by virtue of holding or of having held certain high offices of state. Originally the senate had supreme authority in religious matters, much legislative and judicial power, the management of foreign affairs, etc. At the close of the republic, however, and under the empire, the authority of the senate was little more than nominal apart from certain administrative functions, chiefly fiscal, and from its sittings as a high court of justice and as an appellate tribunal. The original senate of the patricians numbered 100; after the adjunction of the tribes *Titius* or *subines* and *Luceres*, the number became 300, and remained at this figure for several centuries, with the exception of some temporary changes, until the supremacy of Sulla. Julius Caesar made the number 600, and after his death it became over 1,000, but was reduced to 600 by Augustus, and varied under subsequent emperors. (b) The upper or less numerous branch of a legislature in various countries, as in France, Italy, the United States, and in all the separate States of the Union. The Senate of the United States consists of two senators from each State, and numbers (in 1898) 99 members. A senator must be at least thirty years of age, nine years a citizen of the country, and a resident of the State from which he is chosen. Senators are elected by the State legislatures, and sit for six years, but the terms of office are so arranged that one third of the members retire every two years. In addition to its legislative functions, the Senate has power to confirm or reject nominations and treaties made by the President, and also tries impeachments. The vice-president of the United States is the president of the Senate; in his absence a senator is chosen president pro tempore. The upper house of the Canadian Parliament is also called the Senate; its 51 members are appointed by the crown for life. Hence—(c) In general, a legislative body; a state council, the legislative department of a government.

There are 6 species, widely diffused through warm and temperate regions of both hemispheres. They are annual or biennial herbs, nearly prostrate and very much branched, bearing alternate entire or dissected leaves, and minute white or rarely purple flowers in short racemes opposite the leaves. *S. Nilotica* of Egypt has been used as a salad, as has *S. Coronopus*, the wart-cress of England, also known as *vine-cress, herb-ivy, and buck's-horn*. *S. didyma*, the lesser wart-cress, a weed often covering waste ground in western England, is occasionally found naturalized in parts of the Atlantic States.

Cf. senecion.*] 1. A genus of composite plants, type of the tribe *Senecionideæ* and subtribe *Enseneceionæ*. It is characterized by terminal flower-heads with a broad or cylindrical involucre of one or two rows of narrow bracts, numerous regular and perfect disk-flowers with truncate and cylindrical recurved style-branches and nearly cylindrical five- to ten-ribbed achenes, smooth or but slightly downy, and little or not at all contracted at the summit, which bears a copious soft white pappus of slender simple bristles. Some species have flower-heads calyculate with a few bractlets below, and the majority bear spreading pistillate rays, which are, however, minute in some and in others absent. This has been esteemed the largest genus of flowering plants, containing (including *Cacalia*, with Burard, 1888) at least 900 clearly distinct species; it is yet uncertain whether or not it is surpassed by the leguminous species *Astragalus*, under which 1,300 species have been described, but perhaps not over 900 of these are genuine. The species of *Senecio* are mostly herbs, of polymorphous habit, either smooth or woolly, and bear alternate or radical leaves which are entire, toothed, or dissected. Their flower-heads are either large or small, corymbose, panicled, or solitary, and are in the great majority of species yellow, especially the disk-flowers. The genus is of almost universal distribution, but the range of individual species is remarkably limited. They are most abundant in temperate climates; probably about two thirds of the species belong to the Old World, and of these half to South Africa and over a fourth to Europe and the Mediterranean region. About 60 species are found in the United States, including the 9 species of *Cacalia* (Tournefort, 1700), separated by many authors; the others are chiefly low or slender herbs with bright-yellow rays, most numerous in the central States. American species are much more abundant in the Andean region, where they assume a shrubby habit and in three fourths of the species develop no ray-flowers, the reverse of the proportion elsewhere. Many of the Andean species grow close to the snow-line, and have leaves quite glossy and glutinous above and clothed with warm wool beneath; some gummy-leaved species have been used for firewood by the Bolivians under the name *tola*. In St. Helena and New Zealand a number of species become small trees. (See *he-cabbage-tree* and *puka-puka*.) (For the principal British and American species, see *rainwort, Urtica*, and *jacobs-ladder*; for the original species, *S. vulgaris*, a weed sold for cage-birds in London under the names *bird-seed* and *chickenweed*, and also called *senecion* and *sinson*, see *groundsel*.) Several species have been in repute as remedies for wounds, as *S. Sarcocolla* (for which see *Sarcocolla confregia*, under *Sarcocolla*). *S. paludosus* is known as *bird's-tongue*, *S. hieracifolius* as *hawkweed*, and *S. Lyallii*, of New Zealand, as *mountain-marigold*. *S. lobatus*, a tall and rather showy species of the southern United States, is known as *butterweed*, from its fleshy leaves. *S. Cineraria*, a bushy yellow-flowered perennial of Mediterranean shores from Spain to Greece and Egypt, is the dusty-miller of gardens, valued for its numerous long and pinnately cleft leaves, remarkably whitened with

close down; from it the native dusty-miller of the Atlantic coast, *Artemisia Stelleriana*, is distinguished by its short, roundish, less deeply cleft leaves. *S. mikanioides*, Cape Ivy, a tender climber with smooth and shining bright-green angled leaves, from the Cape of Good Hope, is a favorite in cultivation. Several species are cultivated for their flowers under the generic name *Senecio*, as the orange *S. Japaneus*, and the purple and yellow *S. pulcher*, which reach nearly or quite 3 inches in diameter. *S. argenteus*, the silvery senecio, a dwarf 2 inches high, is valued for edgings, and several others for rock-gardens. The most important species, perhaps, are those of the section *Cineraria*, cultivated under glass, some of which have deep-blue rays, a color elsewhere absent from this genus as from most other composite genera.

II. *n.* [*l. c.*] A dealers' name of the small African blood-finches of the genus *Lagonosticta*. They are tiny birds, averaging under 4 inches long, and would be taken for little finches, but belong to the sparrow-like group of the *Ploceidae* (not to *Fringillidae*). More than 20 species of *Lagonosticta* are described, all African; they are closely related to the numerous species of *Spermestes*, all likewise African, and of *Estrilda* and its subdivisions, mainly African, but also Indian, some of which are known to the dealers as *amarantus*, *strawberry-finches*, etc.

The blood-finches (*Lagonosticta* proper) are so called from their leading color, a rich crimson, shaded into browns, grays, and black, and often set off with pearly white spots. Several different birds share the name *senegal*. That to which it specially pertains inhabits Senegambia; it is the *senegali* of the early French and the *fire-bird* or *fire-finch* of the early English ornithologists, the *Fringilla senegala* of Linnaeus, and the *Estrilda senegala* of many writers; it is 3½ inches long, the male mostly crimson, with black tail and brown belly, and the back brown washed over with crimson. *L. miniata* is scarcely different, but slightly smaller, and has a few white dots on the sides of the breast.

sensation (sen-sā'shon), *n.* [*< OF. sensation*, *F. sensation* = *Pr. sensation* = *Sp. sensación* = *Pg. sensação* = It. *sensazione*, *< ML. *sensatio(n)-*, *< L. sensatus*, endowed with sense: see *sensate*.] 1. The action, faculty, or immediate mental result of receiving a mental impression from any affection of the bodily organism; sensitive apprehension; corporeal feeling; any feeling; also, the elements of feeling or immediate consciousness and of consciousness of reaction in perception; the subjective element of perception.

Sensation has to be distinguished from *feeling* on the one hand, and from *perception* on the other. All are abstractions, or objects segregated by the mind from their concomitants, but perception is less so and feeling more so than sensation. Sensation is feeling together with the direct consciousness of that feeling forcing itself upon us, so that it involves the essential element of the conception of an object; but sensation is considered apart from its union with associated sensations, by which a perception is built up. Sensations are either peripheral or visceral. Among the latter are to be specially mentioned sensations of operations in the brain. No approach to a satisfactory enumeration of the different kinds of sensations, even of the peripheral kind, has been made. Those that make motion and sensation thus really the same, they must of necessity acknowledge that no longer motion, no longer sensation, . . . and that every motion or reaction must be a new sensation, as well as every ceasing of reaction a ceasing of sensation. *Dr. H. More*, *Immortal*, of Soul, II, i, 12. The perception which actually accompanies is annexed to any impression on the body made by an external object, being distinct from all other modifications of thinking, furnishes the mind with a distinct idea, which we call *sensation*. *Locke*, *Human Understanding*, II, xix, 1. *Sensation*, so long as we take the analytic point of view, differs from perception only in the extreme simplicity of its object or content. . . . From the physiological point of view both *sensations* and *perceptions* differ from thoughts in the fact that nerve-currents coming in from the periphery are involved in their production. *W. James*, *Prin. of Psychology*, xvii. Impressions may be divided into two kinds, those of *sensation* and those of *reflexion*. The first kind arises in the soul originally, from unknown causes. *Hume*, *Treatise of Human Nature*, I, ii. The feelings which accompany the exercise of these sensitive or corporeal powers, whether cognitive or appetent, will constitute a distinct class, and to these we

may with great propriety give the name of *sensations*; whereas on the feelings which accompany the energies of all our higher powers of mind we may with equal propriety bestow the name of *sentiments*.

Sir W. Hamilton, *Metaph.*, xlv. *Unlucky Welsted!* thy unfeeling master, The more thou ticklest, grapes his fist the faster. While thus each hand promotes the pleasing pain, And quick *sensations* skip from vein to vein. *Pope*, *Dunciad*, ii, 212.

2. A state of interest or of feeling; especially, a state of excited interest or feeling. The *sensation* caused by the appearance of that work is still remembered by many. *Brougham*. A sixth sense is often specified as the muscular sense (distinguished from touch); a seventh is sometimes spoken of, meaning the inner sense, the common sense of Aristotle, an unknown endowment, or a sexual feeling; and further subdivisions also are made. Sensible, Perceptible.** Literally, these words are of about the same meaning and strength, the difference depending chiefly upon the connection; for example, a *sensible* difference, a *perceptible* difference.—3 and 4. *Be Sensible, Be Conscious, etc.* See *feel*, 3 and 7.

Sensible, Sensitive, Sentient. *Sensible* in its first meaning was passive, but is now quite as often active. As active, it is both physical and mental, and is unemphatic; as, to be *sensible* (that is, aware) of heat or cold, of neglect or injury. *Sensitive* means feeling acutely, either in body or in mind. A *sensible* man will school himself not to be too *sensitive* to criticism. *Sentient* is a physiologically descriptive word, indicating the possession or use of the sense of feeling: as, the fly is a *sentient* being.—6. *Observant, aware, conscious.*—8. *Sensible, Judicious, discreet, sage, sagacious, sound.* As compared with *judicious*, *sensible* means possessing common sense, having a sound and practical reason, while *judicious* means discreet in choosing what to do or advise; the one applying to the understanding and judgment, the other to the judgment in its relation to the will. *Sensible, Intelligent, Common-sense.* As compared with *intelligent*, *sensible* means possessed of the power to see things in their true light, the light of a correct judgment, a large, sound, roundabout sense, while *intelligent* means possessed of a clear and quick understanding, so as to apprehend an idea promptly and see it in its true relations. The relation between cause and effect is here so close that *intelligent* often seems to mean essentially the same as *well-informed*. Where the sense implied in *sensible* is thought of as peculiarly general or level to the experience, conclusions, or notions of the mass of men, *common-sense* is, by a new usage, sometimes employed: as, he was a *common-sense* person. He took a *common-sense* view of the matter. All these words apply both to the person and to his opinions, words, writings, etc.

At night each leaf curves downward and the leaflets fold together, and in the daytime a slight touch causes them to assume the same position. It has purple flowers in heads on long peduncles. It is widely diffused through the tropics, native at least in South America and naturalized in the southern United States. The name is extended to other sensitive mimosas, as *M. sensitiva*, which is irritable in a less degree, and sometimes to the whole genus.—**Bastard sensitive-plant.** *Eschynomene Americana*. 4. In *grammar*, a form of words having grammatical completeness; a number of words constituting a whole, as the expression of a statement, inquiry, or command; a combination of subject and predicate. A sentence is either assertive, as *he is good*; or interrogative, as *is he good?* or imperative, as *be good!* Sentences are also classed as simple, compound, or complex; *simple*, if divisible into a single subject and a single predicate; *compound*, if containing more than one subject or predicate or both; and *complex*, if including a subordinate sentence or clause: as, *he who is good is happy*; *I like what you like*; *he goes when I come*. Sentences are further classed as independent and as dependent or subordinate (the latter being more often called a clause than a sentence); a dependent sentence is one which enters with the value of a single part of speech—either noun or adjective or adverb—into the structure of another sentence.

II. *n.*; pl. *septuagenaries* (-riz). A *septuagenarian*.

septuagesima (sep-tū-aj-es'i-mā), *n.* [= *F. septuagesime* = *Sp. Pg. septuagesima* = *It. settagesima* = *G. septuagesima*, < *L. septuagesima* (*dieci*), seventieth (day), fem. of *septuagesimus*, seventieth, < *septuaginta*, seventy; see *septuagint*.] 1. A period of seventy days.—2. [*cap.*] The third Sunday before Lent; more fully called *Septuagesima Sunday*. The original history of this name and of *Sexagesima* (applied to the Sunday following) is not known; and any direct reference to sixty and seventy in these periods of sixty-three and fifty-six days before Easter is not to be traced. The probability is that the use of *quadragesima* for the first Sunday in Quadragesima or Lent, and the independent use of *quingagesima* for the fifth day before Easter (both included), led to the extension of the series by the incorrect application of the names *sexagesima* and *septuagesima* to the two Sundays preceding. Also called *Lost Sunday*, *Albinea Sunday*, see *Sunday*.

septuagesimal (sep-tū-aj-es'i-mal), *a.* [*Septuagesima* + *-al*.] Consisting of seventy, es-

Septuagint (sep'tū-g-jint), *n.* and *a.* [*F. les septante*; *G. septuaginta* (def. 2); < *L. septuaginta* (< *Gr. ἑβδομήκοντα*), seventy; see *seventy*.] 1. *n.* 1. The Seventy—that is, the seventy (or more) persons who, according to the tradition, made a translation of the Hebrew Scriptures into Greek. The rounded legend is that the translation was made by seventy-two persons in seventy-two days. In another view, the Seventy were members of the sanhedrim (about seventy in number) who sanctioned the translation.

The *Septuagints* translation. *Minshen*. 2. A Greek version of the Hebrew Scriptures made by the Seventy (see *def. 1*): usually expressed by the symbol LXX ('the Seventy'). This version is said by Josephus to have been made in the reign and by the order of Ptolemy Philadelphus, King of Egypt, about 270 or 280 years before the birth of Christ. It is supposed, however, by modern critics that this version of the several books is the work, not only of different hands, but of separate times. It is probable that at first only the Pentateuch was translated, and the remaining books gradually; but the translation is believed to have been completed by the second century B. C. The Septuagint is written in the Hellenistic (Alexandrine) dialect, and is linguistically of great importance from its effect upon the diction of the New Testament, and as the source of a large part of the religious and theological vocabulary of the Greek fathers, and (through the Old Latin version of the Bible (see *Italic*) and the influence of this on the Vulgate) of that of the Latin fathers also and of all western nations to the present day. In the Greek Church the Septuagint has been in continuous use from the earliest times, although other Greek versions (see *Hexapla*) were anciently also in circulation, and it is the Old Testament still used in that church. The Septuagint contains the books called *Aperigrapha* intermingled among the other books. It is the version out of which most of the citations in the New Testament from the Old are taken. Abbreviated *Sept.*

II. *a.* Pertaining to the Septuagint; contained in the Greek copy of the Old Testament. **Septuagintal** (sep'tū-g-jin'tal), *a.* [*Septuagint* + *-al*.] Pertaining or relating to the Septuagint; contained in the Septuagint.

The *Septuagintal* tradition was at length set aside. *Smith*, *Dict. of the Bible*, III. 1701.

It is found upon experiment that hydrogen goes through a septum or wall of graphite four times as fast as oxygen. *W. K. Clifford*, *Lectures*, I. 205.

Specifically—(a) In *bot.*, any kind of a partition, whether a proper dissepiment or not; as, the *septum* in a seed; the *septum* of a spore. (b) In *anat.* and *zool.*, a partition; a wall between two cavities, or a structure which divides a part or an organ into separate portions; a dissepiment. In vertebrates the formations known as *septa* are most frequently situated in the vertical longitudinal median line of the body, but may be transverse or otherwise disposed. A number of them are specified by qualifying words. See phrases following. (c) In *corals*, a calcified mesentery; one of the six or more vertical plates which converge from the wall to the axis of the visceral space, dividing this into a number of radiating loculi or compartments. Each septum appears simple or simple, but is really a duplicature of closely apposed plates, just as the mesentery itself is a fold. They are to be distinguished from the horizontal dissepiments, or tabulae, which may cut them at right angles. They are variously modified in details of form, may be connected by synaptulae, and are divided, according to their formation, into *primary, secondary, and tertiary*. (d) In *cinch.*, one of the transverse partitions which separate the cavity of the shell of a cephalopod into chambers. (e) In *vermes*, a sort of diaphragm, a series of which

may partition a worm into several cavities. (f) In *Protozoa*, the wall between any two compartments of the test, as of a foraminifer.—**Branchial, crural, intermuscular, nasal, pectiniform, pericardial septum**. See the adjectives.—**Septum aorticum**, the aortic or anterior segment of the mitral valve.—**Septum atrium, or septum auricularum**, the partition between the right and left auricles of the heart. Septum crurale, a layer of condensed areolar tissue which closes the femoral ring in man, serves as a barrier to the protrusion of a femoral hernia, and is perforated for the passage of lymphatics; badly so named by J. Choquet, and better called *septum femorale*.—**Septum femorale**, the septum crurale. *H. Gray*, *Anat.* (ed. 1888).

Septum linguae, the partition of the tongue; a vertical median layer of fibrous tissue dividing the tongue into right and left halves. It sometimes includes a cartilaginous rod, as the *lytta* or so-called "worm" of a dog's tongue. See *lytta*.—**Septum lucidum**, the median partition of the lateral ventricles of the brain, inclosing the *camera, pseudocula*, or so-called fifth ventricle. Also called *septum pellucidum, septum medianum, septum ventriculorum, ventricular septum, septum medullare triangulare*. See *cut under corpus*.—**Septum narium**, the partition between the right and left nasal cavities or meatus of the nose. In man it is formed chiefly by the mesethmoid, or perpendicular plate of the ethmoid, the vomer, and the triangular cartilage of the nose.—**Septum nasi**. Same as *septum narium*. In zoology it is often restricted to the surface between the openings of the right and left nostrils, which may be of this or that character, deeply cleft as in the hare, hairy or naked, etc.—**Septum orbitale or orbitarium**, the orbital partition; any formation which separates the right and left eye-sockets. The term is less frequently used in relation to mammals, whose eyes are generally small and far apart, than among lower vertebrates, as birds, whose orbits are very large comparatively, and separated only by a thin vertical plate of bone, which may be perforated, or so far defective that the opposite orbits are thrown into one large cavity.—**Septum pectiniforme**, the pectinated septum of the penis, a median vertical partition between the right and left cavernous bodies of that organ. In man it is a dense, firm fibrous structure with many vertical slits, through which the blood-vessels of the opposite sides communicate freely, this comb-like appearance giving the name. It sometimes includes an ossification, the os penis or penis-bone, as in the dog, racoon, etc. Also called *septum penis*.—**Septum pontis**, the septum of the pons Varolii.—**Septum rectovaginale**, the wall which separates the rectal from the vaginal cavity.—**Septum scroti**, the partition between the right and left cavities of the scrotum.—**Septum sphenoidale**, the mesial partition between the sphenoidal sinuses.—**Septum transversum**, the diaphragm; the transverse partition between the thoracic and abdominal cavities.—**Septum ventriculorum, or ventricular septum**. (Endlicher, 1847), named from *Sequoiah*, *Sequoia* Yah (also called George Guess), an Indian of the Cherokee tribe, who invented an alphabet and taught it to his tribe.] A genus of coniferous trees, of the tribe *Abietinæ* and subtribe *Taxodina*. It is characterized by an oval cone, with persistent woody scales each bearing about five ovules, and dilated upward in fruit into a rhomboidal wrinkled and flattened slightly prickly tip.

Part of one of the Big Trees (*Sequoia gigantea*), Mariposa Grove, California. (Diameter, 30 feet.)

ped apex. The flowers are monocious, terminal or axillary on young shoots, with their scales spirally set. The small and involucre staminate flower consists of an oblong column of united stamens, bearing crowded ovate connective scales, each with three to five anthers. The compressed seed bears a thick spongy margin, and contains four to six seed-leaves. There are but two species, both Californian, and ranking among the most remarkable of trees, growing straight, tall, and columnar, with short densely spreading branches, soft red wood, and very thick fibrous and spongy bark. They bear acute, compressed, and keeled decurrent narrow leaves, which are alternate and spirally inserted, or spread in two ranks on the younger branches. Their small cones ripen in the second year. For *S. sempervirens*, discovered by Menzies about 1794, see *redwood*. The other species, *S. gigantea*, by some formerly separated as a genus, *Washingtonia* (Winslow, 1854), and the *Wellingtonia* of English gardens, is the mammoth tree or big tree of California. It is a less graceful tree, with shorter branches, pendulous branchlets, paler appressed leaves, its wood a duller red, with thin white sapwood, its bark near the ground 1 to 2 feet thick, and its cones much larger (2 or 3 inches long). It forms a series of forests in Tulare county, California, isolated groves extending 260 miles northward, and it has been recently reported from southern Oregon. The tallest tree now known, one of the Calaveras grove, is 325 feet high; one in the King's River forest is 35 feet 8 inches in diameter inside the bark 4 feet from the ground, and its age is estimated at over 4,000 years. Both species were early classed under *Taxodium* (which see), their nearest American living relative; a closer ally, however, is *Athrotaxis* (Don, 1839), a genus of three Tasmanian trees distinguished by a cone with mucronate or umbonate scales; their other living relatives are a few distant and mostly monotypic genera of Japan and China. (Compare *Taxodium*.) A very large number of fossil species are known with certainty, showing that the genus was much more abundant in late Cretaceous and Tertiary time than at present.

It was a favorite form of composition with Mozart. Also *cassation* and *divertimento*.

A villain; one of those who in the middle ages were incapable of holding property, were attached to the land and transferred with it, and were subject to feudal services of the most menial description; in *early Eng. hist.*, one who was not free, but by reason of being allowed to have an interest in the cultivation of the soil, and a portion of time to labor for himself, had attained a status superior to that of a slave.

The slave, indeed, still remained [in the fourteenth century], though the number of pure *serfs* bore a small proportion to the other cultivators of the soil. . . . But even this class had now acquired definite rights of its own; and, although we still find instances of the side of *serfs* "with their litter," or family, apart from the land they tilled, yet, in the bulk of cases, the amount of service due from the *serf* had become limited by custom, and, on its due rendering, his holding was practically as secure as that of the freest tenant on the estate.
J. R. Green, *Short Hist. of Eng. People*, v. § 4.

The *serf* was bound to the soil, had fixed domestic relations, and participated in the religious life of the society; and the tendency of all his circumstances, as well as of

the opinions and sentiments of the time, was in the direction of liberation.
Engage, *Brit.*, XIX. 352.

2. A laborer rendering forced service on an estate under seigniorial prescription, as formerly in Russia.

In Russia, at the present moment the aristocracy are dictated to by their emperor much as they themselves dictate to their *serfs*. H. Spenser, *Social Statics*, p. 361.

The next important measure was the emancipation of the *serfs* in 1861. . . . The landowners, on receiving an indemnity, now released the *serfs* from their seigniorial rights, and the village commune became the actual property of the *serf*. Engage, *Brit.*, XXI. 102.

3. Figuratively, an oppressed person; a menial. = *Syn. Serf, Slave*. The *serf* is, in strictness, attached to the soil, and goes with it in all sales or leases. Till the passing of the Judicature Act, 1873, the judges of the superior English common law courts had to be *serjeants*; but this is not now required. No *serjeants* have been created since 1818, and the rank will in all likelihood soon become extinct.

It consisted originally of twenty-four persons, not under the degree of knight, whose duty it was to be in immediate attendance on the king's person. One is assigned by the crown to attend each house of parliament. The lord chancellor, the lord treasurer, and on great occasions the lord mayor of London were each thus attended. One, usually the one attending the House of Lords, is an officer of the Supreme Court, to make arrests, etc.

For the bailiffs of a cite purvey ye must a space
A yemañ of the crowne, *Serjeant* of armes with mace.
Babes Book (E. E. T. S.), p. 157.

The custom seems to have existed since the fourteenth century. The rings were presented to the eminent persons who might be present, their value differing greatly; thus, in 1424, Sir John Fortescue mentions the most costly rings as being given to any prince, duke, or archbishop, and to the lord chancellor and lord treasurer of England, rings of less value to earls, bishops, and certain officials, of less value again to members of Parliament, and so on. — **Sergeant trumpeter**, an officer of the British royal household since the sixteenth century, originally charged with the direction of a band of sixteen trumpeters. [The two spellings *serjeant* and *serjeant* are both correct, and were formerly used indifferently. *Serjeant*, however, is more in accordance with modern analogies, and now generally prevails except in the legal sense, and as applied to feudal tenants, to certain officers of the royal household, and, in part, to officers of municipal and legislative bodies, where the archaic spelling *serjeant* is retained. See def. 1-3, above.]

seriema (ser-i-ē'-mā), *n.* [See *carriama*.] A remarkable South American bird, whose name is as unsettled in orthography as is its position in the ornithological system. It is usually regarded as gallatorial and related to the cranes, but sometimes placed with the birds of prey, next to the African secretary-bird, which it resembles in some respects. It is 3 feet long; the wing 15 inches, the tail 13, the tarsus 7½;

the legs are bare above the suffrage; the head is crested with a frontal egret; the bill is red; the bare orbit bluish; the iris yellow; the plumage is dark, but somewhat variegated with lighter colors, and the tail is tipped with white. In *chem.*, a number of elements or compounds which have certain common properties and relations, or which exhibit, when arranged in orderly succession, a constant difference from member to member. Thus, the elements lithium, sodium, potassium, rubidium, and cesium form a natural series having the familiar properties of the alkalis, and certain striking physical relations to the other elements. The hydrocarbon methane (CH₄), ethane (C₂H₆), propane (C₃H₈), etc., form a series having the constant difference CH₂ between successive members, but all the members having in common great chemical stability, slight reactive properties, and incapacity to unite directly with any element or radical.

In *math.*, a progression; also, more usually, an algebraic expression appearing as a sum of a succession of terms subject to a regular law. In many cases the number of terms is infinite, in which case the addition cannot actually be performed; it is, however, indicated.

7. In *systematic bot.*, according to Gray, the first group below *kingdom* and the next above *class*; equivalent to *subkingdom* or *division* (which see). In actual usage, however, this rule is by no means always observed. In Bentham and Hooker's "Genera" it is a group of cohorts with two stages between it and *kingdom*; and in the same and other good works it may be found denoting the first subdivision of an order, a tribe, a subtribe, a genus, and doubtless still other groups. It appears, however, always to mark a comprehensive and not very strongly accentuated division.

8. In *zool.*, a number of genera in a family, of families in an order, etc.; a section or division of a taxonomic group, containing two or more groups of a lower grade; loosely and variably used, like *grade*, *group*, *cohort*, *phalanx*, etc.—9. Legendrian symbol.—**Discontinuous series**, a series the value of the sum of which does not vary continuously with the independent variable, so that for certain values of the variable the series represents one function and for other values another. Thus, the series

$$\sin \phi = \frac{1}{2} \sin 2\phi + \frac{1}{2} \sin 3\phi + \dots$$

is equal to $\frac{1}{2}$ for values of ϕ between $-\pi$ and $+\pi$; but for values between π and 2π , it is equal to $\frac{1}{2} - \frac{1}{2}$.—**Divergent series**. See *divergent*.—**Double series**, a series the general term of which contains two variable integers. Such a series is the following:

$$\begin{matrix} a_{00} & a_{10} & a_{20} & \dots \\ a_{01} \cos x & a_{11} x \cos x & a_{21} x^2 \cos x & \dots \\ a_{02} \cos 2x & a_{12} x \cos 2x & a_{22} x^2 \cos 2x & \dots \end{matrix}$$

The series is named from the Italian mathematician Fibonacci or Leonardo of Pisa (first part of the thirteenth century), who first considered it. Also called *Lambert's series*.—**Figurate series**, a regular succession of figurate numbers.—**Finite series**, a polynomial consisting of all the terms which satisfy a certain general condition, especially when, by virtue of that condition, they have a determinate linear order.

Functional series, a series in which the general term contains a variable operational exponent.—**Gaussian series**. See *Gaussian*.—**Geometrical series**, a series in which the terms increase or decrease by a common multiplier or common divisor, termed the *common ratio*. See *progression*.—**Gregory's series**, the series are $\tan x = x - \frac{1}{3}x^3 + \frac{1}{5}x^5 - \frac{1}{7}x^7 + \dots$.—**Harmonic series**, the finite series $1 - \frac{1}{2} + \frac{1}{3} - \frac{1}{4} + \frac{1}{5} - \frac{1}{6} + \dots + \frac{1}{n}$, which is nearly equal to $\text{nat log } \frac{1}{n} + \frac{1}{2n} + \frac{1}{6n^2} + \dots$.—**Heine's series**, or **Heine series**, the series

3. Serpentine; winding; tortuous.

P. Fletcher, Purple Island, ii. 9.

II. n. 1. A scaly creature that crawls on the belly; a limbless reptile; properly, a snake; any member of the order *Ophidia* (which see for technical characters). *Serpent* and *snake* now mean precisely the same thing, but the word *serpent* is somewhat more formal or technical than *snake*, so that it seldom applies to the limbless lizards, many of which are popularly mistaken for and called snakes, and *snake* had originally a specific meaning. (See *snake*.) Serpents are found all over the world, except in very cold regions. Most of them are timid, inoffensive, and defenseless animals; others are among the most dangerous and deadly of all creatures. Some are very powerful in consequence of their great size and faculty of constriction, as boas, pythons, and anacondas. Those which are not venomous are known as *innocuous* serpents, or *Innocent*; those which are poisonous are *noxious* serpents, or *Noxious*, sometimes collectively called *Thaumatophidia*. All are carnivorous; and most are

able, by means of their distensible mouths and the great distensibility of their bodies, to swallow animals of greater girth than themselves. In cold and temperate countries serpents hibernate in a state of torpidity. They are oviparous or ovoviviparous, and in some cases the young take refuge from danger by crawling into the cullet of the mother, whence the common belief that snakes swallow their young. Most serpents can be tamed, or at least rendered gentle, by handling; others, as the rat-snake of India, are almost domestic; but the more venomous kinds can be safely handled only when the fangs have been removed. There is a very general misapprehension respecting the comparative numbers of venomous and harmless serpents. Out of more than 300 genera of ophiidians, only about 50, or one-sixth, are poisonous; and more than half of these belong to the two families *Najada* and *Crotalida* (the cobra and the rattlesnake families). The true vipers (*Viperidae*) and the sea serpents (*Hydrophida*), all venomous, have six or eight genera apiece, and four other venomous families have but one to three genera apiece. The proportion of venomous to non-venomous species is still smaller than that of the genera, as the latter will average more species to a genus than the former. Poisonous serpents are mainly confined to tropical and warm temperate countries; they are more numerous and diversified in the Old World than in the New, and rather more forms are *Proteroglyphia* than *Solenoglyphia* (see these words). Serpents large enough to be formidable from their powers of constriction belong to the *Boida* and *Pythonida*. A few families contain very small species, with little in appearance and to some extent in habits. A majority of all serpents belong to one family, the harmless *Colubridae*. See cuts under the various popular and technical names.

And hadde not ben the doubtlet he hadde of a serpent's skyn, deed hadde he ben with outte rector.

2. [cap.] Inastron. a constellation in the northern hemisphere. See *Ophiuchus*.—**3.** A musical instrument, properly of the trumpet family, having a cupped mouthpiece, a conical wooden tube bent to and fro several times and usually covered with leather, and nine finger-holes very irregularly disposed. Its compass extended from two to four octaves upward from about the third C below middle C, and included more or less diatonic and chromatic tones according to the skill of the performer. Its tone was pervasive, though somewhat harsh. It is said to have been invented by a canon of Auxerre in 1300 for use in church music. It was retained in orchestras until the invention of the contrabassoon, and is still occasionally used in French churches.

4. A hydrous silicate of magnesium, occurring massive, sometimes fine, granular, and compact, again finely fibrous, less often slaty. It is usually green in color, but of many different shades, also red, brown, or gray, sometimes with spots resembling a serpent's skin. There are numerous varieties, differing in structure and color. The most important of these are — precious or noble serpentine, under which term are comprised the more or less translucent serpentines, having a rich oil-green color; foliated varieties, including marmolite and antigorite; fibrous varieties, as chrysotile (sometimes called *serpentine asbestos*) and metaxite. Other minerals more or less closely allied to or identical with serpentine are picrolite, williamsite, bowenite, retinalite, balmorite, vorhausite, hydrophite, jenkinsite, villarsite, etc. Serpentine occurs widely distributed and in abundance, forming rock-masses, many of which were formerly regarded as being of eruptive origin, but which are now generally conceded to have been formed by the metamorphism of various rocks and minerals; indeed, it has not been proved that serpentine has ever been formed in any other way than this. The peridotites appear to have been peculiarly liable to this kind of alteration, or serpentinization, as it is called. Massive serpentine has been extensively used for both interior and exterior architectural and decorative purposes, but in only a few localities is a material quarried which stands outdoor exposure without soon losing its polish, and eventually becoming disintegrated. The serpentinous rock commonly called *verd-antique*, and known to lithologists as *ophicalcite*, is a very beautiful decorative material, and has been extensively employed for ornament in various parts of the world. See *verd-antique*.

The family thus included the *Centropomidae* and *Lepidocidae*, as well as true *Serranidae*. fin like a salmon's, and the belly compressed and armed with scales projecting so as to give it a saw-like appearance; typical of the subfamily *Serrasalmoninae*. See *piraya*.

Serrasalmoninae (ser-a-sal-mō-nī-nē), *n. pl.* [*NL.*, *< Serrasalmo (-nē) + -inae*.] A subfamily of characmoid fishes, typified by the genus *Serrasalmo*. They have a compressed high body, with the belly sharply compressed and the scales developed to give a serrated appearance to the dorsal and anal fins; the branchial apertures wide; the branchial membrane deeply incised, and free below, the dorsal fin elongated, and an adipose fin. The teeth are well developed and mostly trenchant. The species are characteristic of the fresh waters of tropical South America. Among them are some of the most dreaded and carnivorous of fishes. By means of their sharp teeth they are enabled to cut the flesh of animals as with a pair of scissors, and where they are found it is impossible for an animal to go into the water without danger. They are attracted by the smell of blood, and congregate from considerable distances to any spot where blood has been spilt. They are best known by the name of *caribbe*. Many species have been

described, some of which attain the length of 2 feet, but most are much smaller. See *praga*.

serrate (ser'at), *a.* [= Sp. *serratus*, < *L. serratus*, saw-shaped, saw-like (cf. *serrare*, pp. *serratus*, saw, saw up), < *serra*, a saw, prob. for **scera*, < *scare*, cut, and thus akin to AS. *saga*, E. *saw*, from the same root: see *scant* and *saw*.] Notched on the edge like a saw; toothed; specifically, in bot., having small sharp teeth along the margin, pointing toward the apex: as, a *serrate* leaf. When a serrate leaf has small serratures upon the large ones, it is said to be *doubly serrate*, as in the elm. The word is also applied to a calyx, corolla, or stipule. A *serrate-ciliate* leaf is one having fine hairs, like the eyelashes, on the serratures. A *serrate-dentate* leaf has the serratures toothed. In zoology and anatomy *serrate* is applied to very many structures much unlike one another, but having more or fewer similar teeth.—**Serrate antennae**, in entom., antennae whose joints are triangular and compressed, presenting a serrate outline on the inner margin: sometimes the outer joints, usually three in number, are enlarged, forming a serrate club. The phrase is sometimes restricted to the interfrontal suture, the sagittal being called *dentate*, and the coronal *limbose*, but the difference is slight, if any, and holds for few animals besides man. See cuts under *cranium* and *parietal*.—**Serrate tibiae**, in entom., tibiae which have a row of sharp teeth along the greater part of the outer edge, as in the *Scolytidae*.—**Serrate unguis**, in entom., unguis or claws having a row of sharp teeth on the lower edge. See cut *J* under *Mordella*.

One who serves or attends, whether voluntarily or involuntarily; a person employed by another, and subject to his orders; one who exerts himself or herself, or labors, for the benefit of a master or an employer; an attendant; a subordinate assistant; an agent. The earlier uses of this word seem to imply protection on the part of the sovereign, lord, or master, and the notion of clientage, the relation involved being one in no sense degrading to the inferior. In modern use it denotes specifically a domestic or menial helper. (See *c.* below.) In law a servant is a person who, for a consideration, is bound to render service under the legal authority of another, such other being called the *master*. Agents of various kinds are sometimes included in the general designation of *servants*; but the term *agent* implies discretionary power, and responsibility in the mode of performing duty, such as is not usually implied in the term *servant*: as, the uniformed *servants* of a railway-company. 3. The time, space, or term during which a court, council, legislature, or the like meets daily for business, or transacts business regularly without breaking up. Thus, a *session* of the legislature commonly means the period from its assembling to its adjournment for the year or season, in contradistinction to its *daily sessions* during that period. So a *session* of Parliament comprises the time from its meeting to its prorogation, of which there is in general but one in each year. Technically at common law it was held that a meeting of Parliament could not be called a *session* unless the sovereign passed an act. The *session* of a judicial court is called a *term*. Also applied in the United States to the daily or half-daily periods of work of a school.

During the twenty-five years of the York dynasty . . . the *sessions* of those parliaments which really met extended over a very few months. *Stubbs, Const. Hist., § 373.*

The *sessions* of the Reichstag must be public; it is not within its choice to make them private. A private *session* is regarded as, legally only a private conference of the members of the Reichstag, and can have no public authority whatever.

In the Established Church of Scotland it is specifically called the *kirk session* (which see, under *kirk*).

The first and second divisions form what is called the *inner house*. There are five permanent lords ordinary, each of whom holds a court, the courts of the lords ordinary forming what is called the *outer house*. The junior lord ordinary officiates in the bill-chamber during session. sessional (ses'hon-al), *a.* [*< session + -al.*] Relating or belonging to a session or sessions.

sestina (ses-tē'nā), *n.* [*It.: see sestina*.] A poem in fixed form, borrowed from the French, and said to have been invented by the Provençal troubadour Arnaut Daniel (thirteenth century). It consisted originally of six stanzas of six unrhimed lines, with a final triplet or half-stanza, also unrhimed—all the lines being of the same length. The terminal words of stanzas 2 to 6 were the same as those of stanza 1, but arranged differently, and they were repeated in the middle of the lines. The modern *sestina* is written on two or three times, and the formula for a two-rimed *sestina* is thus given in the "Vers Français et leur Prosodie" of the best French authority, M. de Gramont: 1, 2, 3, 4, 5, 6; 6, 1, 5, 2, 4, 3; 3, 6, 4, 1, 2, 5; 5, 3, 2, 6, 1, 4; 5, 1, 3, 6, 2; 2, 4, 6, 5, 3, 1; triplet 2, 4, 6 at the end, and 1, 3, 5 at the beginning of the lines. In stanza 1, lines 1, 3, and 5 rhyme, and 2, 5, and 6 rhyme. *Sestinas* were written in Italy by Dante and Petrarch, in Spain and Portugal by Cervantes and Camões, and in England by Dr. Donne and Hawthorne (1758–1649). Mr. Swinburne (in "Poems and Ballads," 2d ser.) has achieved a double *sestina*.

A *sestina* is a poem written neither in rhyme nor blank verse, but in so-called six-line stanzas, each one of which has to take the last word of the stanza preceding it, and twist it about into some new and fantastic meaning.

Athenaeum, No. 3144, p. 14.

In the sense 'sink,' as the sun or stars, it is partly of Scand. origin, *< Icel. red. setsk*, *set*, as the sun, etc. Many uses are highly idiomatic, the verb, like *put*, its nearest equivalent, and *do*, *make*, *get*, etc., having become of almost universal application, and taking its distinctive color from the context.] **I, trans. 1.** To make or cause to rest as on a seat; cause to be put, placed, or seated; place in a sitting, standing, or any natural or normal posture; put; as, to *set* a box on its end or a table on its feet; often with *up* or *down*: as, to *set up* a statue or a flag-staff; to *set down* a burden.

5. In law: (a) The balancing or countervailing of one debt by another. (b) The claim of a debtor to have his debt extinguished in whole or in part by the application of a debt due from his creditor, or from one with whom his creditor is in privity. Set-off is that right which exists between two persons each of whom, under an independent contract, owes an ascertained amount to the other, to set off their respective debts, by way of mutual deduction, so that the person to whom the larger debt is due shall recover the residue only after such deduction. (Kerr.) Set-off, counter-claim, and recoupment are terms often used indiscriminately. Counter-claim is more appropriate of any cross-demand on which the claimant might if he chose maintain an independent action, and on which, should he establish it as a cause of action, either in such independent action or by way of counter-claim when sued, he would be entitled to an affirmative judgment in his own favor for payment of the claim except so far as his adversary's claim might reduce or extinguish it. This use of the word distinguishes it from such claims as may be set off in favor of a person, which yet would not sustain an action by him, nor any affirmative judgment in his favor. Recoupment is appropriate only to designate a cross-demand considered as dependent on the concession of plaintiff's demand, subject to a right to cut down the amount recoverable by virtue of it. In these, which are the strict senses of the words, a recoupment only reduces plaintiff's demand, and leaves him to take judgment for what remains after the deduction; a set-off extinguishes the smaller of two independent demands and an equal amount of the larger, but may leave the residue of the latter unenforced; a counter-claim is one that may be established irrespective of the adversary's success or failure in establishing his claim, and, although subject to be reduced or extinguished by the adversary's success, may otherwise be enforced in the same action.

made the number of intelligence by Philolaus. The common statement that *seven* implies perfection has no further foundation than that the cabalistic meanings of all odd numbers are modes of perfection. One is the first, and was with the Pythagoreans the number of essence (*ovra*). Two involves otherness, and was the number of opinion, "because of its diversity." Three involves mediation, and was the number of beginning, middle, and end. Four naturally suggests a square, and so equity, and was commonly considered the number of justice; but it further carries the suggestion of system, and often has that signification. Five connects itself with the five fingers, used in counting, and thus is an ordinary synecdoche for a small group ("Five of you shall chase an hundred" - Lev. xxv. 8); but the Pythagoreans, for some unknown reason, made it the number of marriage. Six played an important part in the sexagesimal system of the Chaldeans; but its Pythagorean meaning is doubtful. In the Apocalypse 666 is the number of the beast. Eight, being the first cube, would naturally suggest solidity; but according to Dr. Wordsworth it is the dominion or resurrection number. Nine, or three triads, was the number of the great gods of Egypt, and was considered efficient in all magical operations. Ten, for reasons connected with the history of the Pythagorean brotherhood, was considered by them as the great number of power. To eleven no particular significance is attached. Twelve was important in the Chaldean division of the circle, and was the number of the great gods. Thirteen, according to Dr. Mahan, is the number of schism. *Seven* was formerly used generally and vaguely to indicate a large number.

The typical interval of the seventh is that between the first and the seventh tones of a major scale, which is acoustically represented by the ratio 15:8. Such a seventh is called *major*. A seventh a half-step shorter is called *minor*; and one two half-steps shorter is called *diminished*. All kinds of sevenths are classed as dissonances, the minor seventh being the most beautiful and the most useful of dissonant intervals. The seventh produced by taking two octaves downward from the sixth harmonic of the given tone is sometimes called the *natural seventh*; it is sometimes used in vocal music, and on instruments, like the violin, whose intonation is not fixed.

It is usually regarded as a chord of the ninth with the root omitted. Several different resolutions of it are possible. Such a chord on a keyboard instrument like the pianoforte is capable of four enharmonic interpretations, so that it is possible to modulate immediately from it into any one of the keys of the keyboard. Thus, in the key of G minor, the typical chord of the diminished seventh is (a), which on the keyboard is identical with either (b) in the key of E[♭] minor, or (c) in that of C[♯] minor, or (d) in that of F minor.—**Chord of the seventh**, in *music*, a chord of four tones, comprising a root with its third, fifth, and seventh; a seventh-chord or septichord. The most important seventh-chord is that whose root is the dominant of the key; it is often called the *chord of the dominant seventh*. (b) The interval between any tone and a tone on the seventh degree above or below it. (c) The harmonic combination of two tones at the interval thus defined. *d.* In a scale, the seventh tone from the bottom; the leading-tone, sohnized *si*, or, in the tonic sol-fa system, *ti*. The typical interval of the seventh is that between the first and the seventh tones of a major scale, which is acoustically represented by the ratio 15:8. Such a seventh is called *major*. A seventh a half-step shorter is called *minor*; and one two half-steps shorter is called *diminished*. All kinds of sevenths are classed as dissonances, the minor seventh being the most beautiful and the most useful of dissonant intervals. The seventh produced by taking two octaves downward from the sixth harmonic of the given tone is sometimes called the *natural seventh*; it is sometimes used in vocal music, and on instruments, like the violin, whose intonation is not fixed.

Such a chord on a keyboard instrument like the pianoforte is capable of four enharmonic interpretations, so that it is possible to modulate immediately from it into any one of the keys of the keyboard. Thus, in the key of G minor, the typical chord of the diminished seventh is (a), which on the keyboard is identical with either (b) in the key of E[♭] minor, or (c) in that of C[♯] minor, or (d) in that of F minor.—**Chord of the seventh**, in *music*, a chord of four tones, comprising a root with its third, fifth, and seventh; a seventh-chord or septichord. So a *several estate* is one which belongs to one person alone, and although it may in a sense be dependent on others, it is not shared by others during its continuance. (See *estate*, 5.) A *joint and several obligation* is one which so far partakes of both qualities that the creditor may in general treat it in either way, by joining all or suing each one separately.

sex (sēks), *n.* [*ME. scer, scer, < OF. (and F.) scer = Pr. scer = Sp. Pg. scro = It. sesso, < L. sexus, also scrus, sex; perhaps orig. 'division,' i. e. 'distinction' < scru, divide, cut; see scruant.* A less specific designation for 'sex' was *L. genus* = *Gr. γένος, sex, gender*; see *gender, genus*.] 1. The character of being either male or female; the anatomical and physiological distinction between male and female, evidenced by the physical character of their generative organs, and the part taken by each in the function of reproduction; gender, with reference to living organisms. Sex is properly predicable only of male or female, those organisms which are neither male nor female being sexless or neuter. But the two sexes are often combined in the same individual, then said to be hermaphrodite or monocious. Sex runs nearly throughout the animal kingdom, even down to the

protozoans, with, however, many exceptions here and there among hermaphrodites. The distinction of sex is probably the most profound and most nearly universal single attribute of organized beings, and among the higher animals at least it is accompanied or marked by some psychological as well as physical characteristics. The essential attribute of the male sex is the generation of spermatozoa, that of the female the generation of ova, accomplished in the one case by a testis or a homologous organ, and in the other by an ovary or a homologous organ. The act of procreation or begetting in the male is the uniting of spermatozoa to an ovum; the corresponding function in the female is the fecundation of an ovum by spermatozoa, resulting in conception or impregnation. The organs by which this result is accomplished are extremely varied in physical character; and various organs which characterize either sex, besides those directly concerned in the reproductive act, are known as secondary sexual characters. See *gender, generation, reproduction*, and quotation from Buck under *scruant*, 1.

Under his forming hands a creature grew,
Man-like, but different sex. *Milton, P. L., viii. 471.*

3. Especially, the female sex; womankind, by way of emphasis; generally with the definite article.

Twice are the Men instructed by thy Muse,

Baron, Mazeppa, iv.

4. In *bot.*, the character or structure of plants which corresponds to sex in animals, there being, except in the lowest orders, a clear differentiation of male and female elements. deer, the train of the peacock or any other difference in the plumage of a bird between the male and the female, the scrotal glands of any male, the claspers of a fish, and many other features are regarded as secondary sexual characters, and are concerned in sexual selection.—**Sexual affinity.** (a) The unconscious or instinctive attraction of one sex for the other, as exhibited by the preference or choice of any one individual, rather than of any other, of the opposite sex, as a matter of sexual selection. In man such selection is often called *elective affinity* (after Goethe). (b) Such degree of affinity between the sexes of different species as enables these species to interbreed or hybridize. **Sexual dimorphism**, difference of form or of other zoological character in the members of either sex, but not of both sexes, of any animal. Thus, a species of crinoids which has two kinds of males, or a species of butterflies whose females are of two sorts, exhibits sexual dimorphism. The term properly attaches to the adults of perfectly sexed animals, and not to the many instances of dimorphism among sexless or sexually immature organisms. Thus, the honey-bee is not a case of sexual dimorphism, as there is only one sort of perfect males (the drones) and one of perfect females (the queen), though the hive consists mostly of a third sort of bees (workers or undeveloped females). Sexual dimorphism is common among invertebrates, rare in the higher animals.—**Sexual method**, in bot., same as *sexual system* (b).—**Sexual organs**, organs immediately concerned in sexual intercourse or reproduction; the sexual system.—**Sexual reproduction**, reproduction in which both sexes concur; gamogenesis.—**Sexual selection.** See *selection*.—**Sexual system.** (a) In zool. and anat., the reproductive system; the sexual organs, collectively considered. sexuality (sek'sjū-əl-ī-ti), *n.* [*< sexual + -ity.*] 1. The character of sex; the state of being sexual or sexed or having sex; the distinction between the sexes; sex in the abstract.

It was known even before the time of Linnaeus that certain plants produced two kinds of flowers, ordinary open, and minute closed ones; and this fact formerly gave rise to warm controversies about the *sexuality* of plants.

Darwin, Different Forms of Flowers, p. 310.

Sex is a term employed with two significances, which are often confused, but which it is indispensable to distinguish accurately. Originally sex was applied to the organism as a whole, in recognition of the differentiation of the reproductive function. Secondly, sex, together with the adjectives male and female, has been applied to the essential reproductive elements, ovum and spermatozoon, which it is the function of the sexual organisms (or organs) to produce. According to a strict biological definition *sexuality* is the characteristic of the male and female reproductive elements (gametoblasts), and sex of the individuals in which the reproductive elements arise. A man has sex, a spermatozoon *sexuality*.

Buck's Handbook of Med. Sciences, VI. 436.

40 feet high, and is the most handsome of the genus. It is a native of the Malay and Polynesian islands, now cultivated in many warm countries. The fruit is globose or pyriform and orange-like, but very large, weighing sometimes 5 pounds, and of a pale-yellow color; the pulp is yellow, green, pink, or crimson, and is wholesome. The rind and partitions are very bitter. There are numerous varieties, some very juicy and refreshing. The *shadoof* is extensively used in Egypt for lifting water from the Nile for irrigation. The worker dips the bucket in the river, and, aided by the counterpoise weight, empties it into a hole dug on the bank, from which a runnel conducts the water to the lands to be irrigated. In optics *shadow* may be defined as a portion of space from which light is shut off by an opaque body. An opaque object illuminated by the sun, or any other source of light which is not a single point, must have an infinite number of shadows, though these are not distinguishable from each other, and hence the shadow of such an opaque body received on a plane is always accompanied by a *penumbra*, or partial shadow, the complete shadow being called the *umbra*. LG. (also D.) *schacht*, a shaft (in a mine), a particular use, appar. in allusion to its being straight and narrow, of *schacht*, a shaft or rod (as of a spear): see *shaft*¹.] 1. In mining, a vertical or inclined excavation made in opening the ground for mining purposes. A shaft may be sunk vertically, without regard to the dip of the lode, or it may be sunk by an incline following the lode, either closely or approximately, according as its dip is more or less regular. When it is expected that extensive operations will be carried on, the shafts are usually sunk vertically, and connected with the lode at various depths by cross-drifts or levels. When, however, the dip of the lode is pretty uniform and its thickness considerable, all the shafts of the mine may be sunk upon it as inclines. This is the case with the largest mines on Lake Superior. Shafts have various forms, some being round, others oval; but the most common shape is rectangular. In large mines the shaft is usually divided into several compartments, one being used for the pumping-machinery, two or more for hoisting ore, and another for lowering heavy timbers. In the English coal-mines the shafts are mostly circular in section; in Belgium, polygonal; in the anthracite region of Pennsyl-

vania the winding shafts are always square or rectangular, and there the largest shafts have a length of from 44 to 52 feet, and a width of 10 or 12.

a trill; indicated by the mark *tr.*, with or without the sign *vv.* According to modern usage, the principal tone is sounded first, and receives the accent throughout; but in old music the reverse was the case. If the subsidiary tone is chromatically altered, this is indicated by a sharp or a flat added to the sign of the shake. A shake is usually concluded with a turn, and often preceded by a prefix of one or more tones; in the latter case it is said to be *prepared*. A shake occurring in two or three voice-parts at once is called *double* or *triple*. A succession of shakes is called a *chain*. A shake inserted in the midst of a rapid or flowing melody is called *passing*. 6. 7. A crack or fissure in timber, produced during growth by strain of wind, sudden changes of temperature, or causes not well determined, or formed during seasoning. Nearly all exogenous woods are in some degree subject to this defect, which appears in several forms. Heart-shake is a fissure through the center or pith, slight or serious, in its simplest form running the length of the trunk in one plane, in some specimens twisted. Another cleft may cross at right angles. Star-shake consists of radial fissures, sometimes even reaching the circumference. Cup-shake consists of clefts between the concentric layers, occurring most often near the root. All these shakes are commonly called *wind-shakes*.

B. As an auxiliary. 1. Am (is, are, was, etc.) obliged or compelled (to); will (or would) have (to); must; ought (to); need with an infinitive (without *to*) to express obligation, necessity, or duty in connection with some act yet to be carried out.

2. Am (is, are, was, etc.) to (do something speci-
fied by the infinitive); forming verb-phrases
having the value of future and conditional
tenses, and usually (and properly enough)
called such. (a) *Shall* is used in direct assertion to
form the first persons singular and plural of the future
and future-perfect tenses, the second and third persons
in these tenses being formed by *will*. In this connection
shall simply foretells or declares what is about to take
place; as, I *shall* go to town to-morrow; we *shall* spend
the summer in Europe. The future tense of the verb *go*
thus becomes

I <i>shall</i>	We <i>shall</i>
Thou <i>will</i> go;	You <i>will</i> go.
He <i>will</i>	They <i>will</i>

"The use of *shall* instead of *will* in the first person is proba-
bly due to the fact that the act thus announced as about
to take place ensues from the duty or obligation arising
outwardly but contemplated inwardly as proper, and con-
sequently as now about to take place in virtue of a tacit
act of the speaker's will. Should the will or resolution of
the speaker intervene, or be prominent in his mind, then
will would be the proper word to express the futurity of
the act; thus, 'I *will* go' means 'I am determined to go,'
'I have made up my mind to go.' 'I *shall* go home this
evening' announces a future event as settled by consid-
eration outside of the speaker's self; 'I *will* go home this
evening' announces a future event having both its cause
and its accomplishment in the speaker's own mind." (Dr.
Beard.) In indirect assertion *shall* may express mere fu-
turity in the second and third persons; as, he says that he
shall go; he said that he *should* go; in these sentences
"he" refers to one and the same person, the one who
"says." If it referred to any other person, *will* would be
used and not *shall*.

That woman had to water her soup with her furtive
tears, to sit of nights behind hearts and spades, and brood
over her crushed hopes. If I contemplate that wretched
old Niobe much longer, I *shall* begin to pity her.

miss us," said the master.

T. Hughes, Tom Brown at Rugby, ii. 8.

I *shall* stay and sleep in the church.

George Eliot, Romola, xiv.

(b) In the second and third persons *shall* implies author-
ity or control on the part of the speaker, and is used to
express (1) promise; as, you *shall* receive your wages; (2)
command; as, thou *shalt* not steal; (3) determination;
as, you *shall* go.

My glass *shall* not persuade me I am old,
So long as youth and thou are of one date.

(4) Certainty or inevitability as regards the future.
And if I die, no man *shall* pity me [that is, it is certain
no man will pity me].

Shak., Rich. III., v. 3. 201.

(c) Interrogatively, *shall* or *will* is used according as the
one or the other would be used in reply, and accordingly
'*shall* I go?' '*shall* we go?' '*shall* he go?' '*shall* they go?'
ask for direction, or refer the matter to the determination
of the person asked—that is, '*shall* I go?' anticipates the
answer 'you *shall* go.'

Pat. But will you tell me? *Shall* I marry?
Troul. Perhaps.

Upphatch, tr. of Rabelais, iii. 36.

I was employ'd in passing to and fro,
About relieving of the sentinels:
Then how or which way *should* they first break in?

Shak., I Hen. VI., ii. 1. 71.

(d) After conditionals, such as *if* or *whether*, and after
verbs expressing condition or supposition, *shall* expresses
simple futurity in all persons, the idea of restraint or
necessity involved originally in the word *shall* being ex-
cluded by the context—thus:

If (I or we) <i>shall</i>	} say.
Thou <i>shalt</i> , or you <i>shall</i>	
He (or they) <i>shall</i>	

If then we *shall* [that is, are to] shake off our slavish yoke,

duel between the two armies in the Low Countries), being

Shall, like other auxiliaries, is often used with an ellipsis
of the following infinitive.

nor shoulder, but have rather shrouded their way into the

Bunyan, Pilgrim's Progress, ii.

3. The past tense *should*, besides the uses in
which it is merely the preterit of *shall*, as above,
has acquired some peculiar uses of its own. In
some of these uses *should* represents the past subjunctive,
not the past indicative. It is not used to express simple
past futurity, except in indirect speech; as, I said I *should*
[was to] go; I arranged that he *should* [was to] go. *Should*
is often used to give a modest or diffident tone to a state-
ment, or to soften a statement from motives of delicacy or
politeness; thus, 'I *should* not like to say how many there
are' is much the same as 'I hardly like,' or 'I do not like,'
etc. Similarly, 'it *should* seem' is often nearly the same
as 'it seems.'

He is no suitor then? So it *should* seem.

B. Jonson.

Should was formerly sometimes used where we *should*
now use *might*.

The scribis and Pharisees aspien hym that thei *schulden*
fynde cause whereof thei *schulden* accuse hym.

Wyclif, Luke vi. 7.

The distinctions in the uses of *shall* and *will* and of
should and *would* are often so subtle, and depend so much
upon the context or upon subjective conditions, that they
are frequently missed by inaccurate speakers and writers,
and often even by writers of the highest rank. There is a
tendency in colloquial English to the exclusive use of *will*
and (except after a conditional word) *would*.

Cesar *should* [would] be a beast without a heart

If he *should* stay at home to-day for fear.

Shak., J. C., ii. 2. 42.

myself.

A plant with trifoliate leaves: the national em-

the present day most in repute as the true shamrock is
one of the hop-clovers, *Trifolium minus*, a slender trail-

identity of the original shamrock which, according to tra-

Trinity is uncertain. It has been variously supposed to
be the common white clover, *T. repens* (which, however,
is believed to be of late introduction in Ireland); the red
clover, *T. pratense*; the wood sorrel, *Oxalis Aceto-sella*
(locally called *shamrock* in England); and even the water-

shark¹ (shärk), *n.* [Not found in ME. (the ME. name therefore being *hound-fish*); usually de-

rived *< L.* *carcharias*, *< Gr.* *καρχαρία*, a kind of shark, so called from its sharp teeth, *< κάρχαρος*, jagged (of teeth); cf. *καρχαρος*, a crab; Skt. *karkata*, a crab, *karkara*, hard. But the requisite *OF.* forms intermediate between *E.* *shark* and *L.* *carcharias* are not found, and it is not certain that the name was orig. applied to the fish; it may have been first used of a greedy man (see *shark*²).] A selachian of the subclass *Plagiostomi*, of an elongate form, with the pectoral fins moderately developed, the branchial apertures lateral, and the mouth inferior (rarely terminal). Over 150 species are known as inhabitants of the modern seas, and sharks formed a very important or even predominant contingent to the fauna of early epochs. The internal differences manifested by species having a considerable resemblance externally are so great as to have led some naturalists to propose for them three distinct orders, which have been named *Anarthri*, *Proarthri*, and *Opistharthri*. Most living sharks belong to the first order and represent therein 15 families, while of the *Proarthri* only one family with 4 species is known, and of the *Opistharthri* two families with 6 or 7 species. Most sharks are carnivorous, and some of them eminently so; their dentition corresponds to this character, the teeth being often compressed, with trenchant and frequently serrated edges, arranged in many rows, and folded back on the jaws, leaving only the outermost erect for action. These rows of teeth successively come into functional position. In others, however, the teeth are flatfish and not erectile. In a few, also, which attain a large size, the teeth are extremely small, and the animal feeds upon very small animals, being not truly carnivorous. The skin is generally covered with small scales or plates firmly adherent to the skin and overlapping, forming *shagreen*. (See cut under *shagreen*.) But various deviations are manifested in different forms, and in one, *Echinorhina*, the surface is mostly naked, only some thorn-like plates being developed. Sharks inhabit for the most part tropical and warm waters; the larger ones live in the open sea, but a few species extend into high north and south latitudes. The largest shark is *Ischnodon typicus*, the whale-shark, said to attain a length of over 50 feet. Next in size is the great basking-shark, *Cetorhina maximus*, which is reported occasionally to reach a length of 40 feet. (See *Cetorhina*, and cut under *basking-shark*.) Another large species is *Carcharodon carcharias*, among those known as *man-eaters*. The ordinary carnivorous sharks belong to the family *Galeorhinidae* or *Carcharidae*, as the common blue sharks. The topes also belong to this family. (See cut under *Galeorhinidae*.) The hammer-headed sharks belong to the family *Sphyrnidae* or *Ziphiidae*. Fox-sharks or threshers are *Alopiidae*. The porbeagles or mackerel-sharks are *Lamidae*. (See cut under *mackerel-shark*.) Gray sharks or cow-sharks are *Notidae*. (See cut under *Heranchius*.) H. Knight*.—**3.** A strain consisting of a compression in one direction with an elongation in the same ratio in a direction perpendicular to the first. Thus, in fig. 1, suppose a body in which the axis AC is compressed to *ac*. Suppose there is an axis of equal elongation, upon which take BD equal to *ac*, so that after elongation it will be brought to *bd*, equal to *ac*. Then, all planes perpendicular to the plane of the diagram and parallel either to AB or to AD will remain undistorted, being simply rotated into positions parallel to *ab* or *ad*. If the body while undergoing strain be so rotated that *a* and *b* remain in coincidence with A and B (see fig. 2), the shear will be seen

to be an advance of all planes parallel to a fixed plane in parallel lines in those planes by amounts proportional to their distances from the fixed plane. A shear is often called a *simple shear*, meaning a shear uncompounded with any other strain. Any simple strain may be resolved into a shear, a positive or negative elongation perpendicular to the shear, and a positive or negative expansion.

A cutting- or clipping-instrument consisting of two pivoted blades with beveled edges facing each other, such as is used for cutting cloth, or of a single piece of steel bent round until the blades meet, the elasticity of the back causing the blades to spring open when the pressure used in cutting has ceased. The latter is the kind used by furriers, sheep shearers, weavers, etc. Shears of the first kind differ from scissors chiefly in being larger. Implements of similar form used for cutting metal are also called *shears*. See also cuts under *clipping-shears* and *sheep shears*.

Time waited upon the *shears*, and, as soon as the thread was cut, caught the meddles, and carried them to the river of Lethe. *Bacon*, *Advancement of Learning*, ii. 132.

Fuddled bars are also generally sheared hot, either by crocodile or guillotine *shears*, into lengths suitable for piling. *W. H. Greenwood*, *Steel and Iron*, p. 147.

2. Something in the form of the blades of shears. (a) A pair of wings.

Two sharpe winged *shears*.

Were fixed at his backe to cut his awy wayes.

(b) In *bookbinding*, a long, heavy, curved knife, with a handle at one end and a heavy counter-piece at the other end of the blade, which cuts thick millboards, scissors-fashion, against a fixed straight knife on the side of an iron table. (c) An apparatus for raising heavy weights. See *shears*, 2.

3. The ways or track of a lathe, upon which the lathe-head, poppet-head, and rest are placed.

shear-steel (shēr'stēl), n. [So called from its applicability to the manufacture of shears, knives, scythes, etc.] Blister-steel which has been forged and drawn out into bars under the rolls or hammer; a repetition of the process produces what is known as *double-shear steel*. The density and homogeneity of the steel are increased by this process and it is generally admitted that a better result is attained by hammering than by rolling. See *steel*.

shear-structure (shēr'strūk tūr), n. In *geol.*, a structure superinduced in rocks by shearing; a structure varying from lamellar to schistose, somewhat resembling the so-called "fluxion-structure" often seen in volcanic rocks, but produced by the flowing, not of molten, but of solid material, as one of the consequences of the immense strain by which the upheaval or plication of large masses of rock has been accompanied.

sheartail (shēr'tāl), n. 1. A humming-bird of the genus *Phaenastura*, having a very long, forcinate tail, like a pair of shears, as *T. coar.*, *T. haenura*, etc. In the coral hummer (to which the

genus *Thaumastura* is now usually restricted, the others formerly referred to it being placed in *Doricha* the structure of the tail is peculiar: for the middle pair of feathers is so short as to be almost hidden by the coverts, while the next pair is suddenly and extremely lengthened, and then the other three pairs rapidly shorten from within outward. In *Doricha* (*D. hemicura*, etc.) the shape of the tail is simply forked, as the feathers lengthen from the shortest middle pair to the longest outer pair, like a

Sheartail (*Thaumastura cora*).

tern's. In all these cases the long feathers are very narrow and linear, or of about uniform width to their ends. The peculiar formation is confined to the males. *T. cora* has the tail (in the male) about 4 inches long, though the length of the bird is scarcely 6 inches: it is golden-green above and mostly white below, with a metallic crimson gorget reflecting blue in some lights, and the tail black and white. The female is 3½ inches long, the tail being 1½. It inhabits Peru. Five species of *Doricha* range from the Bahamas and parts of Mexico into Central America.

2. A sea-swallow or tern: from the long forked tail. See cut under *rosate*. [Prov. Eng.]—

A sea-bird of the petrel family, *Procellariidae*, and section *Puffinæ*, having a long and comparatively slender, much-hooked bill, short nasal tubes obliquely truncate and with a thick nasal septum, long pointed wings, short tail, and close oily plumage. There are many species, mostly of the genus *Puffinus*, found on all seas, where they fly very low over the water, seeming to shear, shave, or graze it with their long blade-like wings (whence the name). Some of them are known as *hags* or *hagdens*. Three of the commonest are the greater shearwater, *P. major*; the Manx shearwater, *P. anglorum*; and the sooty shearwater, *P. fuliginosus*, all of the North Atlantic. They nest in holes by the seaside, and the female lays one white egg. See cut under *hagden*.

The flesh is edible, the fat is used in dressing leather, and the sound yields a kind of gelatin. It is of elongate form with a small dorsal, no adipose fin, a long anal, and a distinct caudal with a roundish margin; there are six barbels. It takes the place in Europe of the common catfish of North America, and belongs to the same family, but to a different subfamily. (See cut under *Siluridae*.) 2. In zoöl., a hard outer case or covering; a crust; a test; a lorica; a carapace; an indurated (osseous, cartilaginous, cuticular, chitinous, calcareous, silicious, etc.) integument or part of integument. (See *exoskeleton*.) Specifically—(a) In *man*, the peculiar integument of an armadillo, forming a carapace, and sometimes also a plastron, as in the fossil glyptodons. (b) An egg-shell.

(e) In *Mollusca*, the test of any mollusk; the valve or valves of a shell-fish; the chitinous or calcified product of the mantle; a couch. A shell in one, two, or several pieces is so highly characteristic of mollusks that these animals are commonly called *shell-fish* collectively, and many of them are grouped as *Testacea*, *Conchifera*, etc. In some mollusks, as dibrancheate cephalopods, the shell is internal, constituting the pen or cuttle (see *calanary*); in others there is no shell. The shell is secreted chiefly by a mantle or folds of the mantle which are developed around the soft parts, and is usually composed of carbonate of lime. It is generally univalve and spiral, as in most gastropods. In chitons there are eight valves imbricated in a longitudinal series, bound together by a marginal band. In bivalves two shells are developed from and cover the sides of the animal, right and left. (See cuts under *bivalve*.) Some mollusks otherwise bivalve have accessory valves. (f) In *Brachiopoda* there are two valves, but one covers the back and the other the abdominal region, so that the valves are dorsal and ventral. These shells are sometimes composed chiefly of phosphate of lime, as in *lingulas*. (g) In *Crustacea*, the hard chitinous or calcareous integument or crust, or some special part of it; as, the shell of a crab or lobster. (h) In *entom.*: (1) The wing-case of a beetle; an elytron; a shard; as, "cases or shells (elytra)," *Savainson* and *Shuckard*. (2) The cast skin of a pupa, especially of lepidopterous insects; a pupa-shell. (i) In *echinoderms*, the hard crust or integument, especially when it coheres in one hollow case or covering; a test; as, the shell of a sea-urchin. (j) In *Vermes*, the tube or case of a tubicolous worm, when hard, thick, or rigid, like a mollusk's shell; as, the shell of a serpulid. (k) In some *Protozoa*, a silicious or calcareous test or lorica of any kind. Such shells are present under numberless modifications, often beautifully shaped and highly complicated, perforated, cambered, etc., as in foraminifers, radiolarians, sun-animalcules, many infusorians, etc.

3. In *anat.*, some hard thin or hollowed part. (a) A turbanate bone; a scroll-bone. (b) A hollow or cylindrical cast or exfoliation, as of necrosed bone; a squama.

(c) A kind of rough coffin; also, a thin coffin designed to be inclosed by a more substantial one. (d) A racing-boat of light build, long, low, and narrow (generally made of cedar

Shepherd kings, or **Hyksos**, a race or dynasty probably of Semitic origin, who took Memphis and rendered the whole of Egypt tributary. The conquest appears to have taken place about 2200 or 2100 B. They held possession of Paris for a while, and committed many outrages, especially upon the Jews. The movement was soon suppressed. An outbreak of mendicants similarly named took place under Philip V. in 1320, but this also soon came to an end.

Cf. *townreeve, portreeve*.] The chief civil officer charged with administering justice within a county, under direction of the courts, or of the crown or other executive head of the state, and usually having also some incidental judicial functions. (a) In England, the chief officer of the crown in every county or shire, who does all the sovereign's business in the county, the crown by letters patent committing the custody of the county to him alone. Sheriffs are appointed by the crown upon presentation of the judges in a manner partly regulated by law and partly by custom (see *pricking*); the citizens of London, however, have the right of electing the sheriffs for the city of London and the county of Middlesex. Those appointed are bound under a penalty to serve the office, except in specified cases of exemption or disability. As keeper of the queen's peace, the sheriff is the first man in the county, and superior in rank to any nobleman therein during his office, which he holds for a year. He is specially intrusted with the execution of the laws and the preservation of the peace, and for this purpose he has at his disposal the whole civil force of the county—in old legal phraseology, the *posse comitatus*. He has also some judicial functions, less extensive now than formerly. The most ordinary of his functions, which he always executes by a deputy called *under-sheriff*, consists in the execution of writs. The sheriff performs in person such duties only as are either purely honorary, such as attendance upon the judges on circuit, or of some dignity and public importance, such as the presiding over elections and the holding of county meetings, which he may call at any time.

A *shiereve* hadde he been and a countour.

E. A. Freeman, Norman Conquest, V. 294.

(b) In Scotland, the chief local judge of a county. There are two grades of sheriffs, the chief or superior sheriffs and the sheriffs-substitute (besides the lord lieutenant of the county, who has the honorary title of *sheriff-principal*), both being appointed by the crown. The chief sheriff, usually called simply the *sheriff*, may have more than one substitute under him, and the discharge of the greater part of the duties of the office now practically rests with the sheriffs-substitute, the sheriff being (except in one or two cases) a practising advocate in Edinburgh, while the sheriff-substitute is prohibited from taking other employment, and must reside within his county. The civil jurisdiction of the sheriff extends to all personal actions on contract, bond, or obligation without limit, actions for rent, possessory actions, etc., in which cases there is an appeal from the decision of the sheriff-substitute to the sheriff, and from him to the Court of Session. He has also a summary jurisdiction in small-debt cases where the value is not more than £12. To criminal cases the sheriff has jurisdiction in all offenses the punishment for which is not more than two years' imprisonment. He has also jurisdiction in bankruptcy cases to any amount. (c) In the United States, except in New Hampshire and Rhode Island, sheriffs are elected by popular vote, the qualification being that the sheriff must be a man, of age, a citizen of the United States and of the State, and a resident in the county; usually he can hold no other office, and is not eligible for reelection until after the lapse of a limited period. In all the States there are deputy sheriffs, who are agents and servants of the sheriff. In New York and some other States there is, as in England, an under-sheriff, who acts in place of his chief in the latter's absence, etc. The principal duties of the sheriff are to preserve peace and order throughout the county, to attend the courts as the administrative officer of the law, to guard prisoners and juries, to serve the process and execute the judgments of the courts, and to preside at inquisitions and assessments of damages on default.—

High sheriff, the sheriff as distinguished from the under-sheriff and other deputies.—**Joint sheriff**, two persons jointly appointed sheriff, or one of such persons.—**Sheriff of Middlesex**, a decision in 1840, noted in English constitutional history, on the relative powers of Parliament to imprison for contempt and the courts to discharge on habeas corpus.—**Sheriff's jury**. See *jurym*.—**Sheriff turn**, in *early Eng. law*, the periodical court or session held by a sheriff successively in the various hundreds of his county, at which the freeholders were bound to appear as a part of their service.—**Statute of sheriffs**. Shick-shack-day (shik'shak-dá), *n.* [Also *Shiq-shaq-day*; origin obscure.] The 29th of May, or Royal Oak day. *Hallwell*. [Local, Eng.]

When I was at the College School, Gloucester, some twenty years ago, almost every boy wore an oak apple (some of which were even gilded) in his buttonhole on the 29th of May. Those who had not this decoration were called *sotto voce* in the school-room and yelled after in the grove, *Shiq-shaq!* this opprobrious epithet, when uttered at close quarters, being generally accompanied by three pinches. No boy who cared for his peace of mind and wished to save himself some "ups and twacks" would appear in school without at least an oak-leaf in honour of the day.

encumbrance than a safeguard, and by savage peoples to the present day, specifically as distinguished from the buckler, a large implement of the sort, covering the body at least on one side, and carried on the

arm, which passed through rings or straps on its inner side, or hung around the neck by a gudge or strap. The shield of the middle ages was in the tenth century very long, pointed at the bottom and rounded at the top. (See *kite-shield*, below.) At later periods it was changed in size and shape, becoming shorter and smaller, at first triangular and afterward broad, short, and pointed. (See *cu*, and *tilting shield* below.) gone far toward rendering this restricted application of the word of little value. Owing to increase of size, and especially increase in length, some sailing vessels now have four masts, and this is said to have certain advantages. Until recent times wood, such as oak, pine, etc., was the material of which all ships were constructed, but it is being rapidly superseded by iron and steel; and in Great Britain, which is the chief ship-building country in the world, the tonnage of the wooden vessels constructed is small compared with that of vessels built of iron. The first iron vessel classed at Lloyd's was built at Liverpool in 1835, but iron barges and small vessels had been constructed long before this. Four-masted vessels which are square-rigged on all four masts are called *four-masted ships*; those which have fore-and-aft sails on the after mast are called *four-masted barks*. 'separate', 'cut off', a secondary form of *scerian, scerian, scyrian*, cut off, shear; see *shear*. The AS. *scire, scyre* (often erroneously written with a long vowel, *scire, scyre*) is commonly explained as lit. a 'share' or 'portion' (i. e., a section, division), directly *< scerian, scerian*, cut; see *share*, and cf. *share*, from the same source. The mod. pron. with a long vowel is due to the lengthening of the orig. short vowel, as in the other words with a short radical vowel followed by *r* before a vowel which has become silent (e. g., *merit, tired*).] 1. Times' Whistle (E. E. T. S.), p. 46.

The name *scir* [AS. *scire*] or *shire*, which marks the division immediately superior to the hundred, merely means a subdivision or share of a larger whole, and was early used in connexion with an official name to designate the territorial sphere appointed to the particular magistracy denoted by that name. So the diocese was the bishop's *scire*, and the stewardship of the unjust steward is called in the Anglo-Saxon translation of the Gospel his *grosfscire*. We have seen that the original territorial hundreds may have been smaller *shires*. The historical *shires* or counties owe their origin to different causes.

2. A man belonging to "the shires" (which see, under *shire*).

Shireman.—Any man who had not the good fortune to be born in one of the sister counties, or in Essex. He is a sort of foreigner to us; and to our ears, which are acutely sensible of any violation of the beauty of our phraseology, and the music of our pronunciation, his speech soon bewrays him. "Aye, I knew he must be a *shireman* by his tongue." Forby, p. 296.

The presence of the ealdorman and the bishop, who legally sat with him [the sheriff] in the *shire-moot*, and whose presence recalled the folk-moot from which it sprang, would necessarily be rare and irregular, while the *reeve* was bound to attend; and the result of this is seen in the way in which the *shire-moot* soon became known simply as the sheriff's court.

J. R. Green, *Conquest of England*, p. 230.

The *shiremoot*, like the hundredmoot, was competent to declare folkright in every suit, but its relation to the lower court was not properly speaking, an appellate jurisdiction. Its function was to secure to the suitor the right which he had failed to obtain in the hundred.

Stubbs, *Const. Hist.*, § 50.

He then proceeds to state, apparently as a corollary of what may be called his *bloody-shirt* principle, that our Revolution was not popular with what he terms the inferior classes. . . . But most assuredly the Americans did not want a visible signal to push them on; and he who should have displayed a *bloody shirt* for that purpose would have been followed by the contempt of the spectators, and saluted with stones by every idle boy in the streets.

It is due, in part at least, to the over-stimulation and consequent exhaustion of the nervous centers, possibly combined with the inhibitory action of centers rendered too irritable by the over-stimulation or otherwise.

Erethismic shock, in *pathol.* See *erethismic*. — **Shock of the glottis**. See *glottis*. — **Syn. Shock, Collision, Concussion, Jolt.** A *shock* is a violent shaking, and may be produced by a *collision*, a heavy *jolt*, or otherwise; it may be of the nature of a *concussion*. The word is more often used of the effect than of the action: as, the *shock* of battle, a *shock* of electricity, the *shock* from the sudden announcement of bad news. A *collision* is the dashing of a moving body upon a body moving or still: as, a railroad *collision*; *collision* of steamships. *Concussion* is a shaking together; hence the word is especially applicable where that which is shaken has, or may be thought of as having, parts: as, *concussion* of the air or of the brain. *Collision* implies the solidity of the colliding objects: as, the *collision* of two cannon-balls in the air. A *jolt* is a shaking by a single abrupt jerking motion upward or downward or both, as by a springless wagon on a rough road. *Shock* is used figuratively; we speak sometimes of the *collision* of ideas or of minds; *concussion* and *jolt* are only literal.

More fully called *tai shogun* ('great general'), or *sei-i-tai shogun*, 'barbarian-subduing-great-general' (the earlier wars of the Japanese (when this form of the title was first used) having been waged against the 'barbarians' or aboriginal inhabitants of the country. The office was made hereditary in the Minamoto family in 1192, when the title was bestowed on a famous warrior and hero named Yoritomo, and continued in that family or some branch of it until 1868, when it was abolished, and the feudal system virtually came to an end. From the first a large share of the governing power naturally devolved on the shogun as the chief vassal of the mikado. This power was gradually extended by the encroachments of successive shoguns, especially of Iyeyasu, founder in 1603 of the Tokugawa line, and in course of time the shoguns became the virtual rulers of the country—always, however, acknowledging the supremacy of the mikado, and professing to act in his name. This state of things has given rise to the common but erroneous opinion and assertion that Japan had two emperors—"a spiritual emperor" (the mikado), living in Kyoto, and "a temporal emperor" (the shogun), who held court in Yedo (now called Tokio). In the troubles which arose subsequent to 1868 in connection with the ratification and enforcement of the treaties which the shogunate had made with foreign nations, establishing trade relations, etc., many of the daimios, tired of the domination of the shogun and disapproving of the treaties, sided with the emperor; this led in 1867 to the resignation of the shogun of the time, and in the following year the office was abolished, the reigning mikado undertaking to govern the country in person. 14. Not prolonged in utterance; less in duration than times or sounds called long: said of times, vowels, and syllables. Specifically—

(a) In *pros.*, not exceeding in duration the unit of time (*moræ æquivalens*), or so regarded. The primary short vowel of ancient pronunciation varied somewhat in actual duration, but seems to have usually been uttered

as rapidly as was consistent with full distinctness of sound. (See *lung*, n., 2.) Sometimes by method or rhythmical treatment a short syllable, e.g. *pl*, is time

in utterance than a normal short (*tw* is a *diminished short*, *ῥαυτὸν αὐτοσύνετον*), and in what is commonly known as *clision* the first of two vowel sounds, although still audible, was shortened to such a degree as to be entirely

disregarded in metrical composition. A syllable containing a short vowel was regarded as short unless the vowel stood in *position* (which see). Rhythmical or non-musical composition occasionally allowed itself the liberty

short composition or occasionally allowed itself the liberty of treating a prosodic short as a long (an *augmented short*, *συμμετρικὸν ἄρσιν*), and vice versa. In metrical composition a short syllable usually did not take the *ictus*; hence,

in modern versification, an unaccented syllable, whatever its duration, is said to be *short*. A short time, vowel, or syllable is marked by a curved line written independently or above the vowel: thus, \bar{e} , \bar{a} .

The varieties of shorthand now in use are nearly all based on the phonetic principle. The system introduced by Isaac Pitman in 1837, and known as *phonography* (which see) from 1840, has, in its various modifications by its originator and others, a very wide currency wherever the English language is spoken. After the issue of the ninth edition of his work, in 1853, Pitman introduced extensive changes (especially in the vowel-system). The following is a comparative view of Pitman's later and earlier systems and that of a modification of them by J. E. Munson of New York (1866):

Pitman, Munson, and Pitman's Ninth Edition:

Sw. *skulderblad*; as *shoulder* + *blade*.] The scapula (which see). The human shoulder-blade is somewhat peculiar in shape, and some of its parts are named in terms not applicable or seldom applied to scapulae in general. It is a compound bone, including a coracoid as a mere process, and develops from seven centers of ossification, two of which are coracoid. It is commonly said to have two surfaces, three borders, and three angles. Of these, the ventral surface, which lies upon the ribs, is the center; the other surface is the dorsum. This latter is unequally divided into two parts by the development of a high ridge, the spine, extended into a stout process, the acromion. The flat part above the spine is the *supraspinous fossa*; that below the spine, the *infraspinous fossa*; the venter is also called the *subscapular fossa*. These three fossae indicate the primitively prismatic and rod-like character of the bone; and they correspond respectively to the *preacromial*, *postscapular*, and *subscapular* surfaces of a more general nomenclature. The spine being actually in the axis of the scapula, it follows that the long *vertebral border* (a_1 to a_2 in the figure) is the proximal end of the bone. The *glenoid fossa* is at the other end of the bone, at its confluence with the coracoid. The

Human Shoulder-blade or Scapula (right, dorsal surface). a_1 , superior angle; a_2 , inferior angle; ac , acromion; ax , axillary border; ac , coracoid; g , glenoid cavity for articulation with humerus; is , infra-spinous fossa; ss , supra-spinous fossa; v , vertebral border, extending from a_1 to a_2 .

axillary border is one edge of the primitive prism; the *superior border* is another; and the third is along the free edge of the spine. The *suprascapular notch* in the superior border (converted into a foramen by a ligament) denotes the passage there of the vessels and nerve called by the same name. The peculiarities of the human scapula result mainly from its extensive growth downward to the inferior angle (a_2), and with consequent lengthening of the axillary border and of the so-called vertebral "border," and from great development of the spine and acromion. This bone, as usual in the higher vertebrates, has two articulations—with the clavicle and with the humerus; excepting the acromioclavicular articulation, it is attached to the trunk solely by muscles, of which sixteen (sometimes seventeen) arise from or are inserted into the bone. (Compare the shape of the rabbit's shoulder-blade, figured under *metacronion*, and of a bird's, under *scapula*.) See also *cut under shoulder*.

shrinkage (shring'kāj), *n.* [*< shrink + -age*.]

1. The contraction of a material to a smaller surface or bulk, whether by cooling after being heated, as a metal, or by drying, as timber or clay, or by wetting, as cord or fabrics.

Taussig, Tariff History, p. 211.

Allen, and Neurol., VI. 559.

2. Figuratively, a similar reduction of any kind, as loss of weight; especially, loss of value; as, *shrinkage* in real estate.—3. Amount of diminution of surface or bulk, weight or value; as, the *shrinkage* of cast-iron by cooling is one eighth of an inch to a foot; the *shrinkage* on the goods was 10 per cent.—4. In gunn., the difference between the outside diameter of the inner cylinder and the inside diameter of the outer cylinder of a built-up gun. The quantity by which the former exceeds the latter is often called the *absolute shrinkage*, and is expressed in the decimal parts of an inch. *Relative shrinkage* is the ratio obtained by dividing the absolute shrinkage by the interior diameter of the outer cylinder. It is expressed in thousandths and decimal parts of thousandths of an inch, and represents the absolute shrinkage per linear inch of the diameter of the outer cylinder. The *theoretical shrinkage* for a particular gun is that deduced by mathematical computation from known and assumed conditions and dimensions. The *actual shrinkage* is that actually obtained in practice, and varies from the theoretical shrinkage on account of the imperfections of manufacture.

An entirely different kind of *shrinkage-crack* is that which occurs in certain carbonised and flattened plants, and which sometimes communicates to them a marvellous resemblance to the netted under surface of an exogenous leaf.
Dawson, Geol. Hist. of Plants, p. 33.

shrinkage-rule (shring'kāj-röl), *n.* A rule, used by pattern-makers, in which the graduations are so much larger than the normal measurements that the patterns measured off by such a rule will be large enough to allow for shrinkage, without any computation on the part of the workman. The rule must be graduated with reference to the particular metal to be cast.

Cf. *E. dial. shruff*, also *scruff*, refuse wood. See *scrub¹*.] A woody plant with stems branched from or near the ground, and, in general, smaller than a tree; a bush, or woody vine. The line which divides trees from shrubs is to a large extent arbitrary, and is often very unsatisfactory in application, but in general the name *shrub* may be applied to a woody plant of less size than a tree, with several permanent woody stems dividing from the bottom, more slender and lower than in a tree. The line between shrub and herb is also indistinct, as many herbaceous plants are more or less woody. For practical purposes shrubs are divided into the deciduous and evergreen kinds. There are many very ornamental flowering shrubs, among the best-known of which are those belonging to the genera *Rosa*, *Rhododendron*, *Kalmia*, *Viburnum*, *Philadelphus*, *Vaccinium*. Among evergreen shrubs are the box and various heaths. Compare *tree*, *herb*.

Different writers mention from one to twelve sibyls, but the number commonly reckoned is ten, enumerated as the Persian or Babylonian, Libyan, Delphian, Cimmerian, Erythraean, samian, Cumean, Hellespontine or Trojan, Phrygian, and Tiburtine. Of these the most celebrated was the Cumean sibyl (of Cume in Italy), who, according to the story, appeared before Tarquin the Proud and offered him nine books for sale. He refused to buy them, whereupon she burned three, and offered the remaining six at the original price. On being again refused, she destroyed three more, and offered the remaining three at the price she had asked for the nine. Tarquin, astonished at this conduct, bought the books, which were found to contain directions as to the worship of the gods and the policy of the Romans. These sibylline books, or books professing to have this origin, written in Greek hexameters, were kept with great care at Rome, and consulted from time to time by oracle-keepers under the direction of the senate. They were destroyed at the burning of the temple of Jupiter in 83 B. C. Fresh collections were made, which were finally destroyed soon after A. D. 400. The Sibylline Oracles referred to by the Christian fathers belong to early ecclesiastical literature, and are a curious mixture of Jewish and Christian material, with probably here and there a snatch from the older pagan source. In composition they seem to be of various dates, from the second century before to the third century after Christ.

There has been some tendency in England to confine *sick* to the distinctive sense of 'nauseated,' but in America the word has continued to have its original breadth of meaning, as found in the Bible and in Shakespeare. *Diseased* follows the tendency of *disease* to be specific, as in *diseased lungs*, or a *diseased leg*—that is, lungs or a leg affected by a certain disease; but the word may be used in a general way. *Morbid* is a more technical or professional term, indicating that which is not healthy or does not act in a healthy way; the word is also the one most freely used in figurative senses: as, *morbid sensitiveness*, self-consciousness, or irritability. *Sick* and *ill* apply to a state presumably temporary, however severe; *sickly* indicates a state not quite equal to sickness, but more permanent, because of an underlying lack of constitutional vigor. See *illness*, *debility*, *disease*.

Sicyoideæ (sis-i-ō'idē-ē), *n. pl.* [NL. (Endlicher, 1836), < *Sicyos* + *-oides*.] A tribe of polypetalous plants of the order *Cucurbitaceæ* and series *Crenospermeæ*. It is characterized by flowers with from three to five commonly united stamens, and a one-celled ovary with a solitary pendulous ovule, and includes 6 genera, natives of warmer parts of America, or more widely distributed in the type *Sicyos* (see also *Sichuan*). The others, except *Sicyospermis*, a prostrate Texan annual, are high climbing perennials or shrubby vines of Mexico and further south, bearing heart-shaped leaves and fleshy fruit.

Sicyonian (sis-i-ō'ni-an), *a.* and *n.* [*L. Sicyonius* (Gr. *Σικωνίος*), < *Sicyon*, < Gr. *Σικῶν*, *Sicyon* (see def.).] 1. *a.* Of or pertaining to Sicyon, an ancient city of northern Peloponnesus in Greece, or its territory Sicyonia, celebrated as an early and fruitful center of art-development. Also written *Sikyonian*.

Sicyos (sis-i-ōs), *n.* [NL. (Linnaeus, 1737), < Gr. *σικῶς*, a cucumber or gourd.] A genus of plants of the order *Cucurbitaceæ*, the gourd family, and type of the tribe *Sicyoideæ*. It is characterized by monocious flowers, with broadly bell-shaped or flattened five-toothed calyx, and five-parted wheel-shaped corolla, the stamens in the male flowers united into a short column bearing from two to five sessile curved or flexuous anthers. The ovary in the female flowers is bristly or prickly, and is crowned with a short style divided into three stizmas, producing a small flattened coriaceous or woody fruit with acute or long-beaked apex, commonly set with many sharp needles, and filled by a single large seed. There are about 31 species, natives of warm parts of America, one, *S. angulatus*, extending to Kansas and Canada, found also in Australia and New Zealand. They are smooth or rough-hairy climbers, or sometimes prostrate herbs, and bear thin, angled leaves, three-leafed tendrils, and small flowers, the fertile commonly clustered at the base of a staminate raceme. For *S. angulatus*, see *one-seeded* or *star cucumber*, under *cucumber*.

Sida (sī'dā), *n.* [NL. (Linnaeus, 1737), < Gr. *σίδη*, the pomegranate, a water-lily, also, in Theophrastus, a plant of the genus *Althæa* or other malvaceous plant.] 1. A genus of polypetalous plants of the order *Malvaceæ* and tribe *Malvææ*, type of the subtribe *Sidææ*. It is characterized by solitary pendulous ovules and an ovary of a single ring of five or more carpels, which finally fall away from the axis and are each without appendages and indehiscent, or are sometimes at the summit two-valved, bristle-tipped or beaked. There are about 90 species, natives of warm climates, mostly American, with about 23 in Australia and 8 in Africa and Asia. They are either herbs or shrubs, generally downy or woolly, and bearing flowers sometimes large and variegated, but in most species small and white or yellow. Five or six American species are now naturalized as weeds in almost all warm countries, among which *S. spinosa*, a low yellow-flowered annual, extends north to New York and Iowa. Several species are known as *Indian mallow*; *S. Napæa*, a tall white-flowered plant with maple-like leaves, occasional in the eastern United States, is sometimes cultivated under the name *Virginian mallow*; *S. rhombifolia* (from its local use named *Canary Island tea-plant*), a species widely diffused in the tropics, with its variety *retusa*, yields a fiber considered suitable for cordage and paper-making, which, from receiving attention in Australia, has been called *Queensland hemp*. 2. In *zool.*, the typical genus of *Sidææ*.

side (sīd), *n.* and *a.* [*ME. side*, *syde*, rarely *sithe*, < AS. *sīde* = OS. *sīda* = OFries. *side* =

Cf. *beside*, *besides*.] I. n. 1. One of the two terminal surfaces, margins, or lines of an object or a space situated laterally to its front or rear aspect; a part lying on the right or the left hand of an observer, with reference to a definite point of view: as, the *sides* of a building (in contradistinction to its front and rear or back, or to its ends); the *sides* of a map or of a bed (distinguished from the top and bottom, or from the head and foot, respectively).

A sylvan scene with various greens was drawn, shades on the *sides*, and in the midst a lawn. *Dryden*, Pal. and Arc., ii. 620.

2. Specifically, with reference to an animal body: (a) Either half of the body, right or left, which lies on either hand of the vertical median longitudinal plane; the entirety of any lateral part or region: as, the right *side*; the left *side*. (b) The whole or a part of the body in front of or behind a vertical transverse plane: as, the front *side*; the hinder *side*; the dorsal *side*. (c) A part of the body lying laterally with reference to any given or assumed axis, and opposed to another similar or corresponding part: as, the front or back *side* of the arm. (d) A surface or extent of any body, or part of any body, that is external or internal, considered with reference to its opposite: as, the inner or outer *side*. See *inside*, *outside*. (e) Especially, that part of the trunk of an animal which lies or extends between the shoulder and the hip, and particularly the surface of such part; the lateral region or superficies of the chest and belly.

Lest you the Softness of the Sex forsake.

Congreve, tr. of Ovid's Art of Love, iii.

(f) One of the two most extensive surfaces of anything, being neither top or bottom, nor end, nor edge or border. [Since every organism, like any other solid, has three dimensions, to the extent of which in opposite directions side may be applied. It follows that there are three pairs of sides, the word having thus three definitions; a fourth sense is that which relates to the exterior and the (often hollow) interior; a fifth is a definite restriction of right and left *sides*; and a sixth is a loose derived application of the word, without reference to any definite axes or planes.]

3. One of the continuous surfaces of an object limited by terminal lines; one of two or more bounding or investing surfaces; a superficial limit or confine, either external or internal: as, the six *sides* of a cube (but in geometry the word is not thus used for *face*, but as synonymous with *edge*); the *side* of a hill or mountain (hillside, mountain-side); the upper and under *sides* of a plank; the right and wrong *sides* of a fabric or garment (see phrase below); the *sides* of a cavern or a tunnel. The word *side* may be used either of all the bounding surfaces of an object, as with certain prisms, crystals, and geometrical figures, or as exclusive of parts that may be called *top*, *bottom*, *edge*, or *end*, as with a cubical box, a plank, etc.

That crawls along the *side* of yon small hill.

Milton, Comus, l. 245.

4. One of the extended marginal parts or courses of a surface or a plane figure; one of any number of distinct terminal confines or lateral divisions of a surface contiguous to or continuous with another surface: as, the opposite *sides* of a road or a river; the east and west *sides* of the ocean; all *sides* of a field. The outer parts of an oblong or an irregular surface may all be called *sides*, or distinguished as the long and short *sides*, or as *sides* and *ends*, according to occasion. *Side* in this sense is more comprehensive than *margin*, *edge*, *border*, or *verge* (commonly used in defining it), since it may be used so as to include a larger extent of contiguous surface than any of these words. Thus, the sides of a room may be all the parts of its floor-space not comprised in a central part reserved or differentiated in some special way. The sides of a table are those marginal parts upon which food is served. The east and west sides of a continent may constitute jointly the whole of it, or may consist of larger or smaller mar-

ginal strips or divisions, according as they are considered as separated by a mesial line or by some intervening region. The amount of latitude with which the word may be used in particular cases does not admit of definitive discrimination; but there is usually no difficulty in determining the intention of a writer or speaker in his employment of it.

William Morris, Earthly Paradise, l. 4.

5. Position or place with reference to an intermediate line or area; a space or stretch divided from another by the limit or course of something; preceded by *on* and followed by *of*, either expressed or (sometimes) understood: as, a region *on both sides* of a river; we shall not meet again *this side* the grave.

It left the sides, sleeves, and sometimes part of the front of the under-tunic exposed, and either extended to the feet in a full or a partial skirt, or terminated at the knees or the waist.

It appears also to have been a never-failing usage in connection with this fashion of a *sideless* kirtle to display the girdle of the under-tunic, which rested loosely on the hips, as it passed under the *sideless* garment both before and behind.

sidereal (sīd'ēr-ēl), *a.* [Formerly also *syderal*; *< L. sidēralis* (*> It. Sp. sidēral*), *< sidus* (*sider-*), a constellation, a star. Cf. *sidal*.]

Pertaining or relating to the constellations or fixed stars; consisting of or constituted by fixed stars; as, the *sidereal* regions; *sidereal* calculations; a *sidereal* group or system. *Sidereal* distinctively refers rather to stars in the aggregate or as arranged in constellations or groups than to a star considered singly. It is, therefore, not a precise synonym of *stellar* or *astral*, and still less, of course, of *starry*; although in many phrases it is interchangeable with *stellar*. Thus, the "sidereal spaces" are the "stellar spaces," and "sidereal gold" is "starry spangles."

Dict.*—**Sidereal system**, the system of stars. The solar system is considered a member of the sidereal system, in the same sense as the earth with its moon, and Saturn with its satellites, are considered members of the solar system.—**Sidereal time**, time as measured by the apparent diurnal motion of the stars. The sidereal day, the fundamental period of sidereal time, is taken to begin and end with the passage over the meridian of the vernal equinox, the first point of Aries, or the origin of right ascension (three names for the same thing). There is just one more sidereal than mean solar day in a sidereal year. The sidereal day is 3m. 55.901 s. shorter than a mean solar day. The sidereal time of mean noon is 0 hours on March 22d (21st, leap-years), 6 hours on June 21st, 12 hours on September 20th (21st, years preceding leap-years), and 18 hours on December 21st (20th, leap-years). These dates are for the meridian of Washington. For Greenwich it is 0 hours on March 22d in all years, and 6 hours on June 21st in years preceding leap-years. Sidereal time is the only uniform standard of time-measurement; and this cannot be absolutely uniform, since the friction of the tides must tend to retard the motion of the earth.—**Sidereal year**, the time in which the earth makes one complete revolution round the sun. The ratio of the sidereal year to the tropical year is that of unity to unity minus the quotient of the yearly precession by 360°—that is, it is longer than the tropical year by 23m. 23.38 s.; its length is thus 365 days 6 hours 9 minutes 9.5 seconds.

It is one of the important ores of iron. Also called *calchabite*, *spathe*, or *spathe iron*, *juackerde*, *juackerite*. It is characterized by flowers with a five-toothed tubular calyx within which the corolla tube, stamens, and style are all included, a corolla with the upper lip flattish and the lower with a larger middle lobe,

and four didynamous stamens, the anthers of the forward or longer pair usually only half-formed, those of the other pair of two diverging cells. There are about 45 species, natives of the Mediterranean region, abundant in western Asia and extending west to the Canaries. They are herbs or shrubs, usually densely woolly or velvety, with entire or toothed leaves, and small and generally yellowish flowers in axillary whorls or crowded into a dense spike. siderolite (sid'e-rō-līt), *n.* [*< Gr. σιδίρως*, iron, + *λίθος*, stone.] 1. A name first given by N. S. Maskelyne (in the form *acro-siderolite*) to those meteorites which G. Rose had previously called *pallasites*. For meteorites consisting chiefly of metallic (nickeliferous) iron the name *siderite* was proposed by C. U. Shepard, and that of *kolosiderite* by Daubree; but the former is not admissible, because this name was long ago preoccupied by a well-known and widely distributed mineral species, and the latter cannot be accepted, because the majority of the specimens so designated are not wholly of iron. The name *siderolite* has therefore been transferred by M. E. Wadsworth to those meteorites which are composed chiefly of iron—in most cases, however, enclosing more or less irregular and nodular masses of pyrrhotite, schreibersite, graphite, etc. The same author includes in *siderolite* masses of iron of similar character although of terrestrial origin, as those of Ovikaf in Greenland. See *meteorite*, under which the meaning of *pallasite* is given.

1. A ferruginous ochereous earth, fine and smooth, used as a pigment in both oil and water-color painting. The finest is that obtained from Italy. *Raw sienna* is the native pigment prepared by simply drying the material which is taken from the mine or vein and afterward powdering. In composition and appearance it somewhat resembles yellow ochre, but it is deeper in tint and of a browner hue. It gives a highly chromatic orange-yellow, considerably darkened, its luminosity being about half that of a bright chrome-yellow. Its transparency is one of its important qualities, while opacity should be the characteristic of an ochre. *Burnt sienna* is the raw material roasted in a furnace before powdering. By this means the color is changed to a warm reddish brown similar to old mahogany. It is, like raw sienna, translucent in body.

These markings are leaf-scars, and they occur spirally displayed around the stem, and generally arranged on vertical ridges or ribs. Great numbers of species have been described. The variations in the form and arrangement of the leaf scars and of the vascular scars being the points chiefly relied on for specific distinction. *Sigillaria* is but imperfectly known, so far as foliage and fruit are

concerned, but most paleobotanists consider it probable that it will be eventually proved to be closely related to *Lepidodendron*; others refer it to the cycads; while there are some who maintain that it is probable that various plants quite different from one another in their systematic position have been included under the name *Sigillaria*.

The name of a person, or something used as representing his name, affixed or appended to a writing or the like, either by himself or by deputy, as a verification, authentication, or assent (as to a petition or a pledge). The initials, the first or familiar name by which one is known, or the mark or sign of the cross, and the like, if affixed by the person for that purpose, is a legal signature. A British peer uses his title as signature; thus, the Marquis of Salisbury signs himself simply "Salisbury." Prelates of the Church of England adopt signatures from the Latinized designations of their sees; thus, the Archbishop of Canterbury (E. W. Benson) signs himself "E. W. Cantuar."; the Bishop of Oxford (W. Stubbs), "W. Oxon." See *signa*, *v. t.*, 2, 3.

4. In *Scots law*, a writing formerly prepared and presented by a writer to the signet to the baron of exchequer, as the ground of a royal grant to the person in whose name it was presented. This, having in the case of an original charter the sign manual of the sovereign, and in other cases the *cocket* appointed by the act of union for Scotland, attached to it, became the warrant of a conveyance under one or other of the seals, according to the nature of the subject or the object in view. *Imp. Dict.*

5. A letter or figure placed by the printer at the foot of the first page of every section or gathering of a book. The letters begin with A, the figures with 1, and follow in regular order on succeeding sections. They are intended to aid the binder in folding, collating, and arranging the sections consecutively. In early printed books the signature-mark was often repeated on the 3d, 5th, and 7th pages of a section of 16 pages as an additional safeguard for the folder; as, A on 1st page, A i on 3d, A ii on 5th, and A iv on 7th page. This practice has been discontinued except for offsets of 12mos, which have the signature repeated.

Hence—6. A sheet; especially, in bookbinders' use, a sheet after it has been folded and is ready to be gathered.—7. In *musical notation*, the signs placed at the beginning of a staff to indicate the key (tonality) and the rhythm of a piece. The term properly includes the clef (which see), since it determines the form of the key-signature. The key-signature consists of sharps or flats placed upon the degrees corresponding to the black digitals of the keyboard that are to be used; their number and position show also the position of the key-note. The key-signature of a minor key is the same as that of its relative major key. A key-signature made up of sharps is called a *sharp signature*; one made up of flats is called a *flat signature*. The key-signature may be altered in the course of the piece. In this case a heavy bar is inserted, and the sharps or flats that are not to continue in force are nullified by cancels (naturals) prefixed to the new signature. The key-signatures most in use with the common G and F clefs are as follows:

Some slight variations in the above forms occur. (See *key*, *key-signature*, and *circle of keys* (under *circle*)). The rhythmic signature, or time signature, consists of two numerals, the upper of which indicates the number of principal beats in the measure, and the lower the kind of note chosen to represent one such beat. (See *rhythm*, and *rhythmic signature* (under *rhythmical*)). The key-signature is usually repeated at the beginning of every brace; but the rhythmic signature is given but once.

Hence the title of *clerk of the signet*, or *clerk of the signet*, a class of legal practitioners in Edinburgh who formerly had important privileges, which are now nearly abolished. They act generally as agents or attorneys in conducting causes before the Court of Session. In English administration the signet is one of the seals for the authentication of royal grants, which before the abolition of the signet-office in 1848 was there affixed to documents before passing the privy seal, but it is not now required.

Silene (si-lé'ne), *n.* [NL. (Linnaeus, 1737), so called in allusion to the frequent sticky exudation on its stems; < L. *Silene*, *Silēnis*; see *Silēnus*.] A genus of polypetalous plants, of the order *Caryophyllaceae*, type of the tribe *Sileneae*. It is characterized by flowers usually with a five-toothed club-shaped ovary or inflated calyx, five spreading petals upon erect and slender claws commonly with two small scales, ten stamens, and a stalked ovary with one cell, a free central placenta, and usually three styles; the capsule opening at the top by six or by three short valves to discharge the numerous opaque and rounded seeds. About 180 species have been described, but only about 20 are now thought to be distinct. They are annual or perennial herbs of great variety of habit, tall and erect, tufted or procumbent, or partial climbers, with narrow entire opposite leaves, and pink, scarlet, white, or variously colored flowers, commonly in cymes or in one-sided spikes disposed in a terminal panicle. They are abundant in Asia north of the tropics, and in southern Europe and northern Africa, and there are about 12 species in South Africa. Besides 5 or 6 introduced species in the Atlantic border the United States contains about 32 species, chiefly in the Rocky Mountain and Pacific region, about half of which are nearly or quite confined to California. Most of the species are known as *catchfly*. Many are cultivated for their flowers, especially *S. viscaria* and *S. hystrix*, with *S. acaulis*, the sweetwilliam or Lobel's catchfly, native of the south of Europe. *S. Prunellifolia*, a glutinous early-flowering species, is the wild pink of the eastern United States (see *under anthophore*). (For *S. Virginica*, see *fire-pink*, under *pink²*.) Many species with an inflated bladder-like calyx are known in general as *campion*, among which *S. Otites* abundant in sands of eastern Europe and known as *Spanish campion*, is used as an astringent. (For *S. nemoralis*, also known in England as *catch-pink*, see *moose-corn-pink*.) *S. Cucubulus* (*S. inghata*), the bladder-campion, is a wide spread species of Europe, central and northern Asia, now introduced in the Atlantic United States. It is also called *behen* and *spitting poppy*; also, from the shape of its calyx, in America *corbelle*, in England *knappettle* and *whitebottle*. *S. aurdina* of the English coast perhaps a variety of the last) has been called *witches' thimble*.

Sileneae (si-lé'ne-ē), *n. pl.* [NL. (A. P. de Candonolle, 1824), < *Silene* + *-ae*.] A tribe of polypetalous plants of the order *Caryophyllaceae*. It is characterized by flowers with a united and more or less tubular four- or five-toothed calyx, five petals with spreading border and a slender claw often bearing two scales at its summit, usually ten stamens, two or more styles separate to the base—the ovary, stamens, and petals all commonly elevated on a stalk-like gynophore or continuation of the receptacle. It includes 11 genera, all natives of the Old World except certain species of *Dianthus* and *Silene*. (See also *Saponaria*, *Luchula*, and *Gypsophila*.) Most of the genera are cultivated for their ornamental flowers, as the pink, catchfly, etc., which resemble silver shaped flowers, as phlox in form, but are composed of separate petals.

Silent-alarm system. See *fire-alarm telegraph*, under *fire alarm*. **Silent letter**, a letter of a word which is not sounded or pronounced in the enunciation of the word, as the *b* in *doubt*, the *c* in *ritual*, the *d* in *handsome*, the second of the two like consonants in *ebb*, *add*, *off*, etc. The silent letter may be wholly useless, as in the above examples, or it may serve as an accidental or conventional index of the sound given to some adjacent letter: thus, the *c* in *bate*, *note*, *bite*, *note*, etc., is silent, but it indicates that the preceding vowel is long; the *c* in *indict*, the *g* in *sign*, the *l* in *balmy*, etc., serve a similar purpose. Silent letters are traditional, representing sounds that once existed in the word, either in English or in the original tongue (as the *p* and *l* in *psalm*, pronounced in Latin *psalmus*, Greek *ψαλμος*), though often, as in this case, artificially restored after having been omitted (AS. *salun*, ME. *salun*, *salune*), or have been foisted in to suit some false etymology or erroneous analogy, as the *l* in *cold*, the *g* in *foreign*, the *p* in *parliament*, etc. The proportion of silent letters in the present English spelling is about 12½ per cent. **Silent spirit**, distilled spirit which is nearly or quite destitute of flavor and odor. Compare *silence*, 4. **Silent system**, a system of prison discipline which imposes entire silence among the prisoners, even when assembled together. **Silent Week**, Holy Week. Also *Still Week*. **The Silent Sister**, an ironical name of Ireland = *Syn. 1* and *2. Silent, Taciturn, Dumb, Mute.* *Silent* expresses the fact of not speaking, *taciturn* the habitual disposition to refrain from speaking. *Dumb* strictly implies lack of the organs of speech, or defect in them, or lack of the power of speaking, while *mute* implies some special cause: hence *deaf-mute* is thought by many a better name than *deaf-and-dumb person* for one who does not speak on account of deafness; an idol is *dumb*, not *mute*. Under figurative extension *mute*, *dumb*, and *silent* are often used outside of the lines here indicated. In such freer use there is an advance in strength from *silent* to *mute* and from *mute* to *dumb*: as, *silent* from abstraction; *mute* with astonishment; struck *dumb* with horror.

See *bole*, 2.—**Silesian wars**, three wars waged by Frederick the Great of Prussia against Austria, in 1740–42, 1744–45, and 1756–63, ostensibly for the possession of Silesia. F. silhouette*, a profile portrait in black, so called after Etienne de Silhouette, French minister of finance in 1759, whose rigid public economy, intended to avert national bankruptcy, caused his name to be applied to things cheap, especially to things made ostentatiously cheap in derision of him.] **1.** Originally, a portrait in black or some other uniform tint, sometimes varied as to the hair or other parts by lighter lines or a lightening of shade, showing the profile as cast by a candle on a sheet of paper; hence, any opaque portrait, design, or image in profile. *Silhouette* portraits were very common throughout the early years of the nineteenth century, and are often cut out of black paper.

silica (sil'i-kā), *n.* [*NL. < L. silice* (silic-), flint; see *silic*.] Silicon dioxide (SiO₂), or silicic anhydride, a white or colorless substance, nearly insoluble in water and in all acids except hydrofluoric acid. Silica is extremely hard, and fuses with difficulty in the oxyhydrogen flame to a colorless amorphous glass. In nature, as quartz, it is universally distributed, and is the commonest of minerals; here belong the varieties rock-crystal, amethyst, chalcedony,

agate, carnelian, onyx, jasper, flint, hornstone, etc., which differ in degree of crystallization and in purity, and hence in color. Silica in the form of quartz makes the sand of the sea-shore, and rock-masses as quartzite and sandstone. It also occurs as the rare mineral tridymite, known only in volcanic rocks and in a few meteorites, and as the amorphous opal, which is softer and more soluble than quartz and contains more or less water. (See *quartz*, *tridymite*, *opal*, also *asbestos*, *cristobalite*, *metapholyte*.) Silica also forms the material of the spicules of many sponges and of the frustules of diatoms; deposits of the latter are not uncommon under peat-swamps, and in some regions vast beds have been accumulated. (See *infusorial earth*, under *infusorial*.) Silica combines with bases to form compounds called *silicates*, which constitute the rocky crust of the globe. It occurs in solution in the waters of many mineral springs, and sometimes is deposited in enormous quantities about geyser-basins. From the silicates taken up by plants silica is often deposited on the surface or in the interior of their stems. The value of the equisetum, or scouring-rush, is due to the silica contained in it, which sometimes amounts to 18 per cent. of the fresh plant. Sand is extensively used for the manufacture of glass and mortar. The prominent silicates recognized among minerals are the *metasilicates*, salts of metasilicic acid (H₂SiO₃), and *orthosilicates*, salts of orthosilicic acid (H₄SiO₄). Examples are rhodonite, or manganese metasilicate (MnSiO₃), and willemite, or zinc orthosilicate (Zn₂SiO₄). There are also disilicates, polysilicates, etc., but they are rarer, and their nature is less clearly understood. See *glass*, *mortar*, 2, and *sand*, 1. Also called *silic*.—**Infusorial silica**. Same as *infusorial earth* (which see, under *infusorial*).—**Silica bandage**, in *surg.*, a bandage which is moistened with sodium silicate after having been applied.

silicate (sil'i-kāt), *n.* [*L. silic-ic* + *-ate*.] A salt of silicic acid. Silicates formed by the union of silicic acid with the bases alumina, lime, magnesia, potassa, soda, etc., constitute by far the greater number of the minerals which compose the crust of the globe. Glass is a mixture of artificial silicates of alkalis and alkaline earths or metallic oxides (see *glass*).—**Silicate cotton**. See *cotton*, 1.

silicated (sil'i-kā-ted), *a.* [*L. silicate* + *-ed*.] Coated, mixed, combined, or impregnated with silica.—**Silicated soap**, a mixture of sodium silicate and hard soap.

Silicea (si-lis'ē-ā), *n. pl.* [*NL. < L. siler* (silic-), flint; see *silic*.] **1.** Siliceous sponges. See *Silicispongiae*.—**2.** Sponges, excepting *Calcarea*; all non-calcareous sponges. All the existing horny or fibrous sponges are supposed to have been derived from *Silicea* which have lost their spicules, or replaced them by a fibrous skeletal support. The *Silicea*, as a subclass of *Spongiae*, are divided by Von Lendenfeld into three orders—*Hexactinellida*, *Chondrospongiae*, and *Coronaspiongiae*.

Siliceous, *a.* See *Silicispongiae*.

silicic (si-lis'ik), *a.* [*NL. silica* + *-ic*.] Of or pertaining to silica: as, *silicic ether*.—**Silicic acid**, an acid obtained by decomposing a silicate soluble in water with hydrochloric acid, and dialyzing the liquid so obtained. The acid is a colloid, and is obtained in an aqueous solution, which if concentrated sets to a jelly. Silicic acid has not yet been obtained in the pure form, as it undergoes decomposition into water and silica when dried. There are several hypothetical silicic acids, from which the several classes of silicates are supposed to be formed. Such are orthosilicic acid (H₄SiO₄), metasilicic acid (H₂SiO₃), and parasilicic acid (H₂SiO₂). None of these acids has been isolated.—**Silicic ether**, a compound of silicic acid with an alkyl, as methyl silicate ((CH₃)₄SiO₄).

[*L. silica* + *facere*, make, do (see *-fy*).] **I. trans.** To convert into silica, as organic matter of any kind, especially wood.—**Silicified wood**, jasperized wood, or agatized wood, wood which has been changed into the agate or jasper varieties of quartz by a replacement of the cellular structure of the wood by silicious waters, sometimes containing oxides of iron and manganese. Agatized and jasperized wood admitting of a fine polish, and of the richest red, yellow, and brown colors, occurs in immense quanti-

ties in California, Nevada, and Arizona. It is extensively used for ornamental and decorative purposes. Table-tops three feet in diameter have been sawed from a single section.

In the widest sense the *Silicispongiae* include all non-calcareous sponges, whether silicious spicules are present or not, and are the same as *Silicea*, 2. In Sollas's classification the term is restricted to *Micro-mastigota* having a skeleton the scleres of which are not calcareous, being thus the silicious sponges without the *Muzospongiae*. Also *Silicispongiae*. See cuts under *Porifera* and *Spongia*.

Also *silicula*, *silicule*.

silicon (sil'i-kon), *n.* [*< NL. silicon*, < *L. siler* (*silic*-), flint; see *siler*, *silica*.] Chemical symbol, Si; atomic weight, 28.4. A non-metallic element which is obtained in three allotropic forms—namely, amorphous, as a dull-brown powder soluble in alkali, which burns when ignited; graphitic, in crystalline leaves having a strong metallic luster and lead-gray color, insoluble in alkali and non-combustible; and crystalline, in octahedral needles having a red luster, and hardness a little less than that of the diamond. Next to oxygen, silicon is the most abundant element in nature. It is found only in combination, chiefly with oxygen, forming silicon dioxide, or silica, which combined with bases makes up the larger part of the rock-crust of the globe. Also called *silicium*.—**Silicon-brass**, brass prepared with the addition of a small amount of silicon, by which its valuable qualities are said to be improved.—**Silicon-bronze**, copper prepared with the addition of a small amount of silicon-copper, by which its valuable properties for certain uses, as for telegraph-wire, are said to be considerably improved. Weiller's silicon-bronze telegraph-wire was found by analysis to consist of almost chemically pure copper, with 0.02 per cent. of silicon. The silicon-bronze telephone-wire of the same maker contained 1.02 per cent. of zinc, 1.14 of tin, and 0.05 of silicon. Also called *high-silicon iron*, and, of late more generally, *ferro-silicon*. "When the founder understands its [silicon's] use, he may soften and toughen, or harden and strengthen his iron to suit his requirements." (*Kepp and Orton*, Trans. Amer. Inst. Min. Eng. The Chinese word is prob. not connected with the European, except that the *Gr. Σηρ* may mean the Chinese, and be based on the Chinese name for silk. For the more common Teut. word for 'silk,' see *supra*.] 1. *n.* 1. A fine soft thread produced chiefly by the larvae of various bombycid moths, especially of *Bombyx mori* (sericaria), known as *silk-worms*, feeding on the leaves of the mulberry and several other trees. (See *Bombyx* and *silk-worm*, and compare *cut*, 4.) *Silk* is the strongest, most lustrous, and most valuable of textile fibers. The thread is composed of several finer threads drawn by the worm from two large organs or glands containing a viscid substance, which extend, as in other cocoon-making caterpillars, along a great part of the body and terminate in two spinnerets at the mouth. With this substance the silkworm envelops itself, forming its cocoon. *Rare silk* is produced by the operation of winding off at the same time several of these cocoons, after they have been immersed in hot water to soften the natural gum on the filament, on a common reel, thereby forming one smooth, even thread. Before it is fit for weaving it is converted into one of three forms, namely *ingles*, *trams*, or *organzine*. *Singles* (a collective noun) is formed of one of the reeled threads, twisted in order to give it strength and firmness. *Tram* is formed of two or more threads twisted together, and is commonly used in weaving as the *shoot* or *weft*. (For *organzine*, see *thrown silk*, below.) *Silk* of various qualities (but none fully equal to the preceding) is produced by different genera of the family *Saturniidae*, particularly the tusser-worm of India, *Attacus mytila*, the yama-mai of Japan, *Atheria yama-mai*, etc., feeding on the oak and other plants. 2. A similar thread or fiber spun by various other insects, especially some spiders; a kind of cobweb or gossamer. Some such webs are lustrous, and may be reeled like true silk. See *Nephila*, and *cut* under *silk-spider*.—3. Cloth made of silk; by extension, a garment made of such cloth. In this sense the word has a plural, *silks*, denoting different sorts or varieties: as, *black silk*; *white silk*; *colored silks*.

The material is tightly packed in the silo soon after it is gathered (sometimes with addition of a little salt), covered, and pressed down with heavy weights. Thus it is subjected to fermentation, which, if not carried too far, is beneficial rather than injurious. The resulting fodder is analogous in its nutritious quality to sauerkraut, which is the product of fermentation of cabbage. Similar pits or cavities in the ground or in rock have been used from remote times, in various parts of the world, for the prolonged preservation of grain in a dry state, through the careful exclusion of air and moisture.

An umbelliferous plant the juice of which was used by the ancient Greeks as a food and medicine: called in Latin *laserpitum*. (See *laser*, *laserpitum*.) It has been variously identified, as with *Thapsia Garganica*.—2. [*cap.*] [NL. (Linnaeus, 1752).] A genus of composite plants, of the tribe *Helianthoidae* and subtribe *Melampodiaceae*. It is distinguished by its large flower-heads with a broad involucre, sterile disk-flowers, and pistillate and fertile strap-shaped ray-flowers in one or two rows, producing compressed achenes bordered by two wings which are toothed or awned at the apex. Twenty species have been described, of which eleven are now considered distinct. They are natives of the United States, chiefly in the Mississippi valley and Southern States. They are tall rough-hairy perennials, with a resinous juice, bearing alternate, opposite, or whorled leaves of various shapes, and either entire, toothed, or lobed. The yellow flowers (in one species the rays are white) are borne in long-stalked heads, which are solitary or loosely corymbose. *S. terbinthinaeum*, remarkable for its odor of turpentine, is the prairie-dock of the west. Thus, the characteristics of prototypembryos, derived from the adults of a common more or less remote stock of the same division of the animal kingdom, are matters of *silphology*. *Hyatt*.

II. *n.* A name given by Murchison, in 1835, to a series of rocks the order of succession of which was first worked out by him in that part of England and Wales which was formerly inhabited by the Silures. The various groups of fossiliferous rocks included in the Silurian had, previous to Murchison's labors, been classed together as one assemblage, and called by the Germans *grauwacke*, sometimes Anglicized into *graywacke* (which see), also the *Transition series* or *Transition limestone*. In England and Germany these lower rocks have been greatly disturbed and metamorphosed, and have also been frequently invaded by eruptive masses; hence it was not until after considerable progress had been made toward a knowledge of the sequence of the higher fossiliferous groups that the lower (now designated as *Silurian* and *Devonian*) began to be studied with success. Almost contemporaneously with the working out of the order of succession of these lower rocks by Murchison in Great Britain, groups of strata of the same geological age, but lying for the most part in almost entirely undisturbed position, began to be investigated on and near the Atlantic coast of the United States, especially in New York, by the Geological Survey of that State, and a little later in Bohemia by Joachim Barrande. Murchison, Barrande, and James Hall, paleontologist of the New York Survey, are all agreed as to the adoption of the name *Silurian*, and in regard to the essential unity of the series or system thus designated. The Silurian is the lowest of the four great subdivisions of the Paleozoic, namely

Silurian, Devonian, Carboniferous, and Permian. When undisturbed and unmetamorphosed, the Silurian is usually found to be replete with the remains of organic forms, of which by far the larger part is marine. The Silurian is divided into an Upper and a Lower Silurian, and each of these again is subdivided into groups and subgroups varying in nomenclature in various countries. The line between the Upper and Lower Silurian is drawn in Great Britain at the top of the May Hill sandstone or Upper Llandovery group; in New York, at the top of the Hudson River or Cincinnati group. The almost entire absence of vertebrates and of land-plants, and the paucity of plant-life in general, are the most striking features of Silurian life. The most prominent forms of the animal kingdom were the graptolites, trilobites, and brachiopods, and of these the first-mentioned are the most characteristic of all, since they range through nearly the whole Silurian, and disappear in the Devonian; while the trilobites, which begin at the same time with the graptolites, continue through the Devonian, and end only with the Carboniferous. As the line between the Silurian and Devonian is commonly drawn in England—namely, so as to include in the former the Ludlow group—the first vertebrates, in the form of a low type of fishes, appear near the top of the Upper Silurian; traces of land-animals (scorpions) have also been found in the Upper Silurian of Sweden and Scotland; and in France, in the Lower (?) Silurian, traces of insect life. A scorpion has also been found in the United States, at Waterville, New York, in the Waterlime group, or near the middle of the Upper Silurian. Mr. Whittell, by whom the specimen was described, inclines to the opinion that the species, for which he instituted a new genus (*Trooscorpion*), was aquatic and not air-breathing, and that it forms a link between the true aquatic forms like *Eurypterus* and *Pterygotus* and the true air-breathing scorpions of subsequent periods. He intimates that the same is likely to be true of the Swedish and Scottish Silurian scorpions. The traces of land-plants in the Silurian are rare, and for the most part of doubtful identification. Algae, on the other hand, are of somewhat frequent occurrence. As the line between Silurian and Devonian is drawn in the United States—namely, between the Oriskany sandstone and the Catskill grit—there are neither land-animals nor fishes in the Silurian; and the evidence of the existence of land plants lower than the Devonian is for the most part of a very doubtful character. The Silurian rocks are widely spread over the globe, with everywhere essentially the same types of animal life. This part of the series is of importance in the United States, especially in the northeastern Atlantic States and in parts of the Mississippi valley.

silurid (si-lū'rid), *a.* and *n.* Same as *siluroid*.

Siluridae (si-lū'ri-dē), *n. pl.* [NL., < *Silurus* + *-idae*.] A very large family of physostomous fishes, of the order *Nematognathi*, represented by such forms as the sheat-fish of Europe and the catfishes or cats of America. It was the same as *Siluridae* of Cuvier. By Cope its name was used for *Nematognathi* with the anterior vertebrae regularly modified, the inferior pharyngeal bones separate, and an operculum developed. It thus contrasted with the *Aspredinidae* and *Hypophthalmidae*, and included all the *Nematognathi* except those belonging to the two families named. By Gill the family was restricted to those *Nematognathi* which have the anterior vertebrae regularly modified; the lower pharyngeal bones separate; the operculum developed; a dorsal fin, in connection with the abdominal portion of the vertebral column, rather short, and preceded by the spine; the pectoral fins armed with well-developed spines having a complex articulation with the shoulder-girdle; and the body naked, or with plates only along the lateral line. The lower jaw has no reflected lip, and there are usually from four to eight pairs of barbels, maxillary barbels being always developed. Species of the family thus limited are very numerous, several hundred having been described, and referred to many genera. Most of them inhabit fresh water, especially of tropical and subtropical countries, but many are also found in tropical seas. In Europe, one, the sheat-fish, *Silurus glanis*, oc-

curs in the central and eastern regions of the continent; while a second, more southerly, and supposed to be the *glanis* of the ancients, has lately (1890) been distinguished as *Silurus (Parasilurus) ariostictus*. In North America the family is represented by a number of species belonging to different subfamilies, which are generally known under the name of *catfishes*. The leading genera of North America are *Noturus*, stone-cats; *Ambloplites*, ordinary cats, pouts, bullheads, etc.; *Ictalurus*, channel-cats; *Arius*, sea-cats; and *Etheostichus* (or *Felichthys*), gaff-top-sails. See also cuts under *catfish*, *gaff-top-sail*, *pout*, and *stone-cat*.

Silvanus (sil-vā'nus), *n.* [L.: < *silva*, a wood, a forest: see *sylva*.] 1. A Roman rural deity. He is usually represented with a sickle in his right hand and a bough in his left, and is described as the protector of herds from wolves and of trees from lightning, and a patron of agriculture in general, and as the defender of boundaries.

(Latreille, 1807).] A genus of clavicorn beetles, of the family *Curculionidae*, consisting of small, slender species with five-jointed tarsi in both sexes, the fourth joint very small, and antennal joints from nine to eleven, abruptly enlarged. It contains about 25 species, several of which are cosmopolitan. They live under the bark of trees or in stored food-products. *S. scutellatus* is found all over the world, feeding on many kinds of drugs, all stored farmaceutic products, etc.

Some attempt to connect *silver* with L. *sulfur*, sulphur (see *sulphur*), others with Gr. *αἰδύρος*, iron.] I. *n.* 1. Chemical symbol, Ag; atomic weight, 107.93. A metal of a white color, having a specific gravity of 10.4 to 10.7 (according as it is cast, rolled, or hammered), harder than gold, and softer than copper, having a tenacity about equal to that of gold, and melting at a temperature a little lower than copper. Its whiteness is remarkable, that of tin alone among the common metals nearly approaching it; among the rare metals, indium and lithium are equal to silver in color and luster. Silver crystallizes in the regular (isometric) system; but, although native silver is of frequent occurrence, distinct crystals are very rare. Arborescent and liform shapes are most common, but very large solid masses have been found. Silver occurs in a great variety of ores, being mineralized by sulphur, antimony, and arsenic, as well as by chlorine, iodine, and bromine. These ores are widely distributed over the world. Silver is very commonly associated with lead; and the common ore of the latter metal, galena, always contains some silver, and generally enough to make its separation remunerative. Silver has also been detected in the water of the ocean. The principal silver-producing regions are the Andes and Cordilleras. From Peru and Bolivia came an immense supply of this metal during the sixteenth and seventeenth centuries. Mexico has been a large producer of silver since the middle of the sixteenth century. The mines of the Comstock lode at Virginia City, in Nevada, produced about \$320,000,000 worth of bullion from 1860 to 1890, about five twelfths of the value of which was silver. This metal has always been accounted "precious," and has been used for ornament and as a measure of value from the earliest times of which there is any historical record. Its most marked point of inferiority to gold, apart from color, is its liability to tarnish when exposed to sulphurous emanations or brought into contact with anything containing sulphur. Silver is too soft to be used in the unalloyed condition. The ratio of silver to copper in the silver coinage of England is 925 to 75 (or 12 to 1); that of France and the United States, 9 to 1; and in that of Prussia, 3 to 1. The world's production of silver, estimated in dollars (at the coinage rate of \$1,292.90 per ounce), has increased from \$84,000,000 in 1879 to \$216,000,000 in 1894. In the United States the production increased from \$41,000,000 in 1879 to \$82,000,000 in 1895. In 1893 it was \$77,000,000, in 1894 \$64,000,000, in 1895 about \$60,000,000, and in 1896 about \$70,000,000. From the foundation of the government until 1873, when the free coinage of

silver was stopped (see *coinage*, *ratio*, *dollar*), about 85,000,000 were coined. Under the silver-purchase acts of 1873 and 1890 over \$22,000,000 have been coined, but only about \$10,000,000 are in circulation. (See *silver certificate*, below.) The total amount of silver purchased by the government from Feb. 12, 1873, to Nov. 1, 1893 (when the purchase act of 1890 was repealed), was 106,291,859 ounces, at a cost of \$509,362,975. Political agitation for the resumption of the free coinage of silver at the existing ratio (about 16 to 1) has been carried on vigorously in the West and South since about 1875; and in 1896 the Democratic party made this the chief plank in its platform, and was defeated on this issue.

German silver, a white alloy of copper, zinc, and nickel, used as a cheap substitute for silver, and as a superior article for plated ware, being covered with silver by plating as is the cheaper Britannia metal. The relative proportions of the metals in the alloy called German silver vary considerably, according to the desire of the manufacturer to produce a cheaper or more expensive article. The commonest kind contains about eight parts of copper, two of nickel, and three to five of zinc. A finer kind of alloy is obtained by adding more nickel; the metal is then less liable to tarnish, and the resemblance to silver in color and luster is more striking. Nickel is a much more expensive metal than copper, and very much more so than zinc. See *nickel*.—**King's silver,** (a) A name given to silver used in England from about 1500 to 1720 for plate of an unusually high standard; apparently introduced by workmen from the continent, and abandoned because not sufficiently hard and durable. It is a native of the mountains of central and southern Europe, planted elsewhere. It grows from 80 to 120 or even 200 feet high. Its timber is soft, tough, and elastic, of a creamy-white color, useful for many building and cabinet purposes, for making the sounding-boards of musical

instruments, etc. It yields resin, tar, and the straining turpentine. This is the "*white fir*" (*fall* *Tannenbaum* of the Germans). The silver fir of the Alleghany region, etc., is a distinct species called *baloo* or *baloo* of *Gladst.* It is a tree 10 to 12 feet high, its twigs sought for scented candles, its bark for tanning Canada balsam. (See *balsam*, also the uses of spruce gum.) Pacific North America presents several other silver firs, as *A. grandis*, the white fir of the coastlands, and *A. nobilis* and *A. magnifica*, the red fir of the mountains of Oregon and California, all trees 100 to 200 feet high, and 12 to 18 inches in diameter.

Silver fox, the common red fox, *Vulpes rubra*, in a lustrous variation, much lighter in color, is 1 foot 10 inches, overlaid with hoary silver rays, about the lower parts. It is an extreme case of the red fox, and is called the normal color, of which the cross is a variety. It occurs in the red foxes of both America and Europe, especially in high latitudes, and is still the color of *Vulpes argentatus* or *argentatus* of various writers. The silver fox has sometimes been defined as a variety of the gray fox of the United States, *Vulpes canescens* or *argentatus*, perhaps by some misapprehension of *S. f. ruber* (1779) specific name just cited. But this is a distinct species of a different genus, and one in which the silver-black variation is not known to occur. Compare *cut* under *cross fox*.

While the Cross and Black and *Silver Foxes* are usually considered as different varieties, they are not such in the classificatory sense of that term any more than are the red, black, or white wolves, the black in erms, squirrels, etc. The proof of this is in the fact that one or both of the "varieties" occur in the same litter of whelps from normally colored parents. They have no special distribution, although, on the whole, both kinds are rather northerly than otherwise, the *Silver Fox* especially so. *Comes and Yarrow*, *Wheeler's Expl. 3. [Tr. Gr. *ὁμοιος*.] In geometry, of the same shape: said of two figures which have all their corresponding angles equal, whence it will follow, for ordinary Euclidean space, that all their corresponding lengths will be proportional, that their corresponding areas will be in the duplicate ratio of their lengths, and that their corresponding volumes will be in the triplicate ratio of their lengths. In the non-Euclidean systems of geometry these consequences are falsified, so that there are no similar figures.

The law of similars. (a) The law of mental association by which similar ideas are connected in the mind and suggest one another. This kind of association is denied by some psychologists, who forget that without it *similarity* would have no possible meaning. When we say that today's idea is like yesterday's, we can only mean that a sense of affinity connects them. The kind of association is the essential condition of generalization. Prior, *Alma*, iii.

=**Syn.** *Simile*, *Metaphor*, *Comparison*, *Allegory*, *Parable*, *Fable*, *similitude*, *trope*. The first six words agree in implying or expressing likeness between a main person or thing and a subordinate one. *Simile* is a statement of the likeness in literal terms; as, man is like grass; Herod is like a fox. *Metaphor* taxes the imagination by saying that the first object is the second, or by speaking as though it were: as, "All flesh is grass," Isa. xl. 6; "Go ye and tell that fox," Luke xiii. 32. There are various combinations of *simile* and *metaphor*: as, "We all do fade as a leaf," Isa. lxi. 6;

"There are a sort of men whose visages Do cream and mantle, like a standing pool" (*Shak.*, M. of V., i. 1. 89).

In these the *metaphor* precedes; in the following the *simile* is in the middle of the *metaphor*: "These metaphysical rights, entering into common life, like rays of light which pierce into a dense medium, are, by the laws of Nature, refracted from their straight line." (*Burke*, *Rev.* in France.) In the same way the *simile* may come first. A *comparison* differs from a *simile* essentially in that the former fixes attention upon the subordinate object, while a *simile* fixes it upon the main one; thus, one verse of Shelley's "Ode to the Skylark" begins by saying that the skylark is like a poet, whose circumstances are thereupon detailed. Generally, on this account, the *comparison* is longer than the *simile*. The *allegory* personifies abstract things, usually at some length. A short *allegory* is P's. lxxx. 8–16. Spenser's "Faery Queene" is a series of *allegories* upon the virtues, and Bunyan's "Pilgrim's Progress" allegorizes Christian experiences. These are acknowledged to be the most perfect *allegories* in literature. The *allegory* is an extended *simile*, with the first object in the *simile* carefully left unmentioned. A *parable* is a story that is or might be true, and is used generally to teach some moral or religious truth: as, the three *parables* of God's great love for the sinner in Luke xv. Socrates' story of the sailors who chose their steersman by lot, as suggesting the folly of a similar course in choosing the helmsman of the state, is a fine example of the *parable* of civil life. A *fable* differs from a *parable* in being improbable or impossible as fact, as in making trees choose a king, beasts talk, or frogs pray to Jupiter; it generally is short, and points a homely moral. See the definitions of *apologue* and *trope*.
